

INTEGRATED TECHNOLOGY EXPRESS, INC.

IT8671F & IT8687R

GIGA I/O Chipset

Preliminary Specification V0.5

Copyright © 2000 ITE, Inc.

This is Preliminary document release. All specifications are subject to change without notice.
The material contained in this document supersedes all previous documentation issued for the related products included herein. Please contact ITE, Inc. for the latest document(s).

All sales are subject to ITE's Standard Terms and Conditions, a copy of which is included in the back of this document.

ITE, IT8671F & IT8687R are trademarks of ITE, Inc.

Intel, Pentium, and MMX are claimed as trademarks by Intel Corp.

Cyrix, M1, and SLiC/MP are claimed as trademarks by Cyrix Corp.

AMD, AMD-K5, and AMD-K6 are claimed as trademarks by Advanced Micro Devices, Inc.

Microsoft and Windows are claimed as trademarks by Microsoft Corporation.

PCI is claimed as a trademark by the PCI Special Interest Group.

IrDA is claimed as a trademark by the Infrared Data Association.

All other trademarks are claimed by their respective owners.

All specifications are subject to change without notice.

Additional copies of this manual or other ITE literature may be obtained from:

Revision History

| Section | Revision | Page No. |
|---------|---|----------|
| 1 | • In the features of Keyboard Controller, the 5 th and 6 th feature items in the previous version were removed. | 1 |
| 6 | • The descriptions of bits 7, 6, 5 in section 6.10.9 were revised. | 26 |

CONTENTS

Page

| | |
|--|-----------|
| 1. Features | 1 |
| 2. General Description..... | 1 |
| 3. Pin Configuration | 2 |
| 4. Block Diagram | 3 |
| 5. IT8671F Pin Descriptions | 4 |
| 6. Configuring Sequence Description | 7 |
| 6.1 MB PnP Mode | 8 |
| 6.2 ISA PnP Mode | 8 |
| 6.2.1 Plug and Play Operation Sequence | 9 |
| 6.3 Description of the Configuration Registers | 10 |
| 6.3.1 Logical Device Base Address..... | 15 |
| 6.4 Global Configuration Registers (LDN : All)..... | 16 |
| 6.4.1 Set RD_DATA Port (Index=00h, ISA PnP) | 16 |
| 6.4.2 Serial Isolation (Index=01h, ISA PnP) | 16 |
| 6.4.3 Configure Control (Index=02h, ISA PnP/MB PnP)..... | 16 |
| 6.4.4 Wake[CSN] (Index=03h, ISA PnP)..... | 16 |
| 6.4.5 Resource Data (Index=04h, ISA PnP) | 16 |
| 6.4.6 Status (Index=05h, ISA PnP) | 16 |
| 6.4.7 Card Select Number (CSN, Index=06h, Default=00h, ISA PnP) | 16 |
| 6.4.8 Logical Device Number (LDN, Index=07h, ISA PnP/MB PnP) | 16 |
| 6.4.9 Chip ID Byte 1 (Index=20h, Default=86h, MB PnP)..... | 16 |
| 6.4.10 Chip ID Byte 2 (Index=21h, Default=81h, MB PnP)..... | 17 |
| 6.4.11 Chip Version (Index=22h, Default=00h, MB PnP) | 17 |
| 6.4.12 PnP Logical Device Enable Register (Index=23h, Default=00h, MB PnP) | 17 |
| 6.4.13 Software Suspend (Index=24h, Default=00h, MB PnP) | 17 |
| 6.4.14 GPIO[11:8] Function Enable Register (Index=25h, Default=00h, MB PnP)..... | 17 |
| 6.4.15 GPIO[7:0] Function Pin Enable Register (Index=26h, Default=00h, MB PnP) | 18 |
| 6.4.16 Reserved Register (Index=2Eh, Default= 00h, MB PnP) | 18 |
| 6.4.17 Test Enable Register[7:0] (Index=2Fh, Default=00h, MB PnP)..... | 18 |
| 6.5 FDC Configuration Registers (LDN=00h) | 18 |
| 6.5.1 FDC Activate (Index=30h, Default=00h, ISA PnP/MB PnP) | 18 |
| 6.5.2 FDC I/O Range Check (Index=31h, Default =00h, ISA PnP) | 18 |
| 6.5.3 FDC Base Address MSB Register (Index= 60h, Default=03h, ISA PnP/MB PnP) | 18 |
| 6.5.4 FDC Base Address LSB Register (Index=61h,Default=F0h, ISA PnP/MB PnP)..... | 18 |
| 6.5.5 FDC Interrupt Level Select (Index=70h, Default=06h, ISA PnP/MB PnP)..... | 18 |
| 6.5.6 FDC Interrupt Type (Index=71h, Default=02h, ISA PnP) | 19 |
| 6.5.7 FDC DMA Channel Select (Index=74h, Default=02h, ISA PnP/MB PnP)..... | 19 |
| 6.5.8 FDC Special Configuration Register (Index=F0h, Default=00h, MB PnP)..... | 19 |
| 6.6 Serial Port 1 Configuration Registers (LDN=01h)..... | 19 |
| 6.6.1 Serial Port 1 Activate (Index=30h, Default=00h, ISA PnP/MB PnP) | 19 |
| 6.6.2 Serial Port 1 I/O Range Check (Index=31h, Default=00h, ISA PnP)..... | 19 |
| 6.6.3 Serial Port 1 Base Address MSB Register (Index=60h, Default=03h, ISA PnP/MB PnP) | 19 |
| 6.6.4 Serial Port 1 Base Address LSB Register (Index=61h, Default=F8h, ISA PnP/MB PnP) | 19 |
| 6.6.5 Serial Port 1 Interrupt Level Select (Index =70h, Default=04h, ISA PnP/MB PnP)..... | 19 |
| 6.6.6 Serial Port 1 Interrupt Type (Index=71h, Default=02h, ISA PnP)..... | 20 |
| 6.6.7 Serial Port 1 Special Configuration Register (Index=F0h, Default=00h, MB PnP) | 20 |
| 6.7 Serial Port 2 Configuration Registers (LDN=02h)..... | 20 |
| 6.7.1 Serial Port 2 Activate (Index=30h, Default=00h, ISA PnP/MB PnP) | 20 |
| 6.7.2 Serial Port 2 I/O Range Check (Index=31h, Default=00h, ISA PnP) | 20 |
| 6.7.3 Serial Port 2 Base Address MSB Register (Index=60h, Default=02h, ISA PnP/MB PnP) | 20 |
| 6.7.4 Serial Port 2 Base Address LSB Register (Index=61h, Default=F8h, ISA PnP/MB PnP) | 20 |
| 6.7.5 FIR Base Address MSB Register (Index=62h, Default=03h, ISA PnP/MB PnP)..... | 20 |
| 6.7.6 FIR Base Address LSB Register (Index=63h, Default=00h, ISA PnP/MB PnP)..... | 20 |
| 6.7.7 Serial Port 2 Interrupt Level Select (Index=70h, Default=03h, ISA PnP/MB PnP)..... | 20 |
| 6.7.8 Serial Port 2 Interrupt Type (Index=71h, Default=02h, ISA PnP) | 21 |
| 6.7.9 FIR Interrupt Level Select(Index =72h, Default=0Ah, ISA PnP/MB PnP)..... | 21 |

| | | |
|-------------|--|-----------|
| 6.7.10 | FIR Interrupt Type (Index=73h, Default=02h, ISA PnP)..... | 21 |
| 6.7.11 | FIR DMA Channel Select 1 (Index=74h, Default=00h, ISA PnP/MB PnP) | 21 |
| 6.7.12 | FIR DMA Channel Select 2 (Index=75h, Default=01h, ISA PnP/MB PnP) | 21 |
| 6.7.13 | Serial Port 2 Special Configuration Register 1 (Index=F0h, Default=00h, MB PnP)..... | 21 |
| 6.7.14 | Serial Port 2 Special Configuration Register 2 (Index=F1h, Default=00h, MB PnP)..... | 21 |
| 6.8 | Parallel Port Configuration Registers (LDN=03h)..... | 22 |
| 6.8.1 | Parallel Port Activate (Index=30h, Default=00h, ISA PnP/MB PnP) | 22 |
| 6.8.2 | Parallel Port I/O Range Check (Index=31h, Default=00h, ISA PnP)..... | 22 |
| 6.8.3 | Parallel Port Primary Base Address MSB Register (Index=60h, Default=03h, ISA PnP/MB PnP) | 22 |
| 6.8.4 | Parallel Port Primary Base Address LSB Register (Index=61h, Default=78h, ISA PnP/MB PnP) | 22 |
| 6.8.5 | Parallel Port Secondary Base Address MSB Register (Index=62h, Default=07h, ISA PnP/MB PnP) | 22 |
| 6.8.6 | Parallel Port Secondary Base Address LSB Register (Index=63h, Default=78h, ISA PnP/MB PnP) | 22 |
| 6.8.7 | Parallel Port Interrupt Level Select (Index =70h, Default=07h, ISA PnP/MB PnP) | 22 |
| 6.8.8 | Parallel Port Interrupt Type (Index=71h, Default=02h, ISA PnP) | 23 |
| 6.8.9 | Parallel Port DMA Channel Select (Index= 74h, Default=03h, ISA PnP/MB PnP)..... | 23 |
| 6.8.10 | Parallel Port Special Configuration Register (Index=F0h, Default=03h, MB PnP)..... | 23 |
| 6.9 | APC Configuration Registers (LDN=04h) | 23 |
| 6.9.1 | Reserved Register(Index=30h, Default=00h, ISA PnP/MB PnP) | 23 |
| 6.9.2 | APC Configuration Register 1 (Index=F0h, Default=00h, MB PnP) | 23 |
| 6.9.3 | APC Configuration Register 2 (Index=F1h, Default=00h, MB PnP) | 23 |
| 6.9.4 | APC Status Register (Index=F2h, Default=00h, MB PnP) | 24 |
| 6.9.5 | APC Special Control Register 4 (Index=F4h, Default=00h, MB PnP) | 25 |
| 6.9.6 | APC Special Control Register 5 (Index=F5h, Default=00h, MB PnP) | 25 |
| 6.9.7 | APC Special Control Register 6 (Index=F6h, MB PnP) | 25 |
| 6.10 | KBC (keyboard) Configuration Registers (LDN=05h)..... | 25 |
| 6.10.1 | KBC (keyboard) Activate (Index=30h, Default=01h or 00h, ISA PnP/MB PnP) | 25 |
| 6.10.2 | KBC(keyboard) I/O Range Check (Index=31h, Default=00h, ISA PnP)..... | 25 |
| 6.10.3 | KBC (keyboard) Data Base Address MSB Register (Index=60h, Default=00h, ISA PnP/MB PnP) | 25 |
| 6.10.4 | KBC (keyboard) Data Base Address LSB Register (Index=61h, Default=60h, PnP ISA/MB PnP) | 26 |
| 6.10.5 | KBC (keyboard) Command Base Address MSB Register (Index=62h, Default=00h, ISA PnP/MB PnP) | 26 |
| 6.10.6 | KBC (keyboard) Command Base Address LSB Register (Index=63h, Default=64h, ISA PnP/MB PnP) | 26 |
| 6.10.7 | KBC (keyboard) Interrupt Level Select (Index=70h, Default=01h, ISA PnP/MB PnP) | 26 |
| 6.10.8 | KBC (keyboard) Interrupt Type (Index=71h, Default=02h, ISA PnP) | 26 |
| 6.10.9 | KBC (keyboard) Special Configuration Register (Index=F0h, Default=00h, MB PnP)..... | 26 |
| 6.11 | KBC (mouse) Configuration Registers (LDN=06h) | 27 |
| 6.11.1 | KBC (mouse) Activate (Index=30h, Default=00h, ISA PnP/MB PnP)..... | 27 |
| 6.11.2 | KBC (mouse) Interrupt Level Select (Index=70h, Default=0Ch, ISA PnP/MB PnP) | 27 |
| 6.11.3 | KBC (mouse) Interrupt Type (Index=71h, Default=02h, ISA PnP) | 27 |
| 6.11.4 | KBC(mouse) Special Configuration Register (Index=F0h, Default=00h, MB PnP) | 27 |
| 6.12 | GPIO & Alternate Function Configuration Registers (LDN=07h) | 27 |
| 6.12.1 | CS0 Base Address MSB Register (Index=60h, Default=00h, MB PnP)..... | 27 |
| 6.12.2 | CS0 Base Address LSB Register (Index=61h, Default=00h, MB PnP)..... | 27 |
| 6.12.3 | CS1 Base Address MSB Register (Index=62h, Default=00h, MB PnP)..... | 27 |
| 6.12.4 | CS1 Base Address LSB Register (Index=63h, Default=00h, MB PnP)..... | 27 |
| 6.12.5 | CS2 Base Address MSB Register (Index=64h, Default=00h, MB PnP)..... | 27 |
| 6.12.6 | CS2 Base Address LSB Register (Index=65h, Default=00h, MB PnP)..... | 28 |
| 6.12.7 | Simple I/O Base Address MSB Register (Index=66h, Default=00h, MB PnP)..... | 28 |
| 6.12.8 | Simple I/O Base Address LSB Register (Index=67h, Default=00h, MB PnP)..... | 28 |
| 6.12.9 | Reserved Register (Index=68h, Default=00h, MB PnP)..... | 28 |
| 6.12.10 | Reserved Register (Index=69h, Default=00h, MB PnP)..... | 28 |
| 6.12.11 | GPIO Interrupt Steering 1 Control Register (Index=70h, Default=00h, MB PnP) | 28 |
| 6.12.12 | GPIO Blinking Control Register (Index=71h, Default=00h, MB PnP) | 28 |
| 6.12.13 | GPIO Interrupt Steering 2 Control Register (Index=72h, Default=00h, MB PnP) | 28 |

| | | |
|-----------|--|-----------|
| 6.12.14 | Reserved Register (Index=73h, Default=00h, MB PnP) | 28 |
| 6.12.15 | GPIO[7:0] Pin Polarity Register (Index=F0h, Default=00h, MB PnP) | 28 |
| 6.12.16 | CS0/CS1/CS2 Control Register (Index=F1h/F2h/F3h, Default=00h, MB PnP) | 29 |
| 6.12.17 | GPIO[7:0] Function Selection Register (Index=F4h, Default=00h, MB PnP) | 29 |
| 6.12.18 | Simple I/O[7:0] Direction Selection Register (Index=F5h, Default=00h, MB PnP) | 29 |
| 6.12.19 | Zero Wait State Control & GPIO IRQ Sharing Enable Register (Index=F6h, Default=00h, MBPnP) | 29 |
| 6.12.20 | Zero Wait State Device Enable Register (Index=F7h, Default=00h, MB PnP) | 29 |
| 6.12.21 | GPIO[11:8] Pin Polarity Register | 29 |
| 6.12.22 | GPIO[11:8] Function Selection Register (Index=F9h, Default=00h, MB PnP) | 30 |
| 6.12.23 | Simple I/O[11:8] Direction Selection Register (Index=FAh, Default=00h, MB PnP) | 30 |
| 6.12.24 | APC POR# & RING# Pin Select Register (Index=FBh, Default=00h, MB PnP) | 30 |
| 6.12.25 | Reserved Registers (Index=FCh/FDh/FEh, Default=00h, MB PnP) | 30 |
| 6.12.26 | Keyboard Lock Input Control Register (Index=FFh, Default=00h, MB PnP) | 30 |
| 6.12.27 | SMI Enable Register 1 (Index=E0h, Default=00h, MB PnP) | 30 |
| 6.12.28 | SMI Enable/Control Register 2 (Index=E1h, Default=00h, MB PnP) | 30 |
| 6.12.29 | SMI Status Register 1 (Index=E2h, Default=00h, MB PnP) | 31 |
| 6.12.30 | SMI Status Register 2 (Index=E3h, Default=00h, MB PnP) | 31 |
| 6.12.31 | Reserved Register (Index=E4h, Default=00h, MB PnP) | 31 |
| 7. | Functional Description | 32 |
| 7.1 | General Purpose I/O | 32 |
| 7.2 | Advanced Power Supply Control | 35 |
| 7.2.1 | PANSWH# and PSON# | 35 |
| 7.3 | FDC Register Description | 36 |
| 7.3.1 | Digital Output Register (DOR) - (Base Address + 02h) | 36 |
| 7.3.2 | Main Status Register (MSR) - (Base Address + 04h) | 36 |
| 7.3.3 | Data Register (FIFO) - (Base Address + 05h) | 37 |
| 7.3.4 | Digital Input Register (DIR) - (Base Address + 07h) | 37 |
| 7.3.5 | Diskette Control Register (DCR) - (Base Address + 07h Write) | 37 |
| 7.3.6 | Status Register | 37 |
| 7.3.7 | Reset | 39 |
| 7.3.8 | Controller Phases | 39 |
| 7.3.9 | Data Transfer Commands Description | 39 |
| 7.4 | Serial Channel Register Description | 52 |
| 7.4.1 | Data Register | 52 |
| 7.4.2 | Control Registers: IER, IIR, FCR, DLL, DLM, LCR and MCR | 52 |
| 7.4.3 | Status Register LSR and MSR | 56 |
| 7.4.4 | Reset | 58 |
| 7.4.5 | Programming | 58 |
| 7.4.6 | Software Reset | 58 |
| 7.4.7 | Clock Input Operation | 59 |
| 7.4.8 | FIFO Interrupt Mode Operation | 59 |
| 7.5 | Parallel Port | 60 |
| 7.5.1 | SPP and EPP Modes | 61 |
| 7.5.2 | EPP Operation | 62 |
| 7.5.3 | ECP Mode | 63 |
| 7.6 | Keyboard Controller (KBC) | 71 |
| 7.6.1 | System Interface | 71 |
| 7.6.2 | Data Registers and Status Register | 71 |
| 7.6.3 | Program Memory | 72 |
| 7.6.4 | Program Status Word | 72 |
| 7.6.5 | Data Memory | 73 |
| 7.6.6 | Instruction Timing | 73 |
| 7.6.7 | Timer/Counter Operation | 73 |
| 7.6.8 | KIRQ and MIRQ | 74 |
| 8. | DC Electrical Characteristics | 75 |
| 9. | AC Characteristics (VCC = 5.0V ± 5%, Ta = 0°C to + 70°C) | 78 |
| 9.1 | READ Cycle Timing | 78 |
| 9.2 | WRITE Cycle Timing | 78 |

| | |
|--|-----------|
| 9.3 FDC Timing | 79 |
| 9.3.1 DMA Operation Timing | 79 |
| 9.3.2 Terminal Count, Index | 79 |
| 9.3.3 FDD WRITE/READ Operation Timing..... | 80 |
| 9.3.4 SEEK Operation Timing..... | 80 |
| 9.4 Serial Port Timing..... | 81 |
| 9.4.1 Transmitter | 81 |
| 9.4.2 Modem | 82 |
| 9.4.3 Receiver | 83 |
| 9.4.4 IrDA Receive Timing..... | 83 |
| 9.4.5 IrDA Transmit Timing..... | 84 |
| 9.4.6 ASKIR Receive Timing | 84 |
| 9.4.7 ASKIR Transmit Timing | 85 |
| 9.5 Parallel Port Timing..... | 85 |
| 9.5.1 Control Signal Delay Time | 85 |
| 9.5.2 Interrupt Request Timing | 86 |
| 9.6 EPP Address or DATA WRITE Cycle | 87 |
| 9.7 EPP Address or DATA READ Cycle | 88 |
| 9.8 ECP Parallel Port Forward Timing Diagram..... | 89 |

1. Features

■ Plug and Play v1.0a Compliant

- Built-in resource data ROM
- Five logical devices
- 16-bit address decoding
- Eleven selectable IRQs
- Four selectable DMA channels
- PC 97/98 I/O solution (PC99 Ready)
- Supports IRQ sharing

■ 2.88MB Floppy Disk Controller

- 48mA direct output driver
- Enhanced digital data separator
- A and B drives can be logically swapped via registers
- 3-Mode drives supported
- Supports automatic write protection via software
- Supports two 360K/ 720K/ 1.2M/ 1.44M/ 2.88M floppy disk drives

■ Multi-Mode High Performance Parallel Port

- Standard mode -- bi-directional SPP
- Enhanced mode -- EPP v1.7 and EPP v1.9 compliant

- High speed mode -- ECP, IEEE1284 compliant
- Backdrive current reduction
- Printer power-on damage reduction

■ Advanced Power Control

■ Serial Ports

- Supports two 16C550 standard compatible enhanced serial ports
- Supports SIR or ASKIR
- MIDI compatible

■ Keyboard Controller

- 8042 compatible
- 2KB programmable ROM
- 256-byte data RAM
- GateA20 and Keyboard reset output
- Supports key lock function
- Supports PS/2 mouse

■ Five volt operation

■ 100 pin QFP package

2. General Description

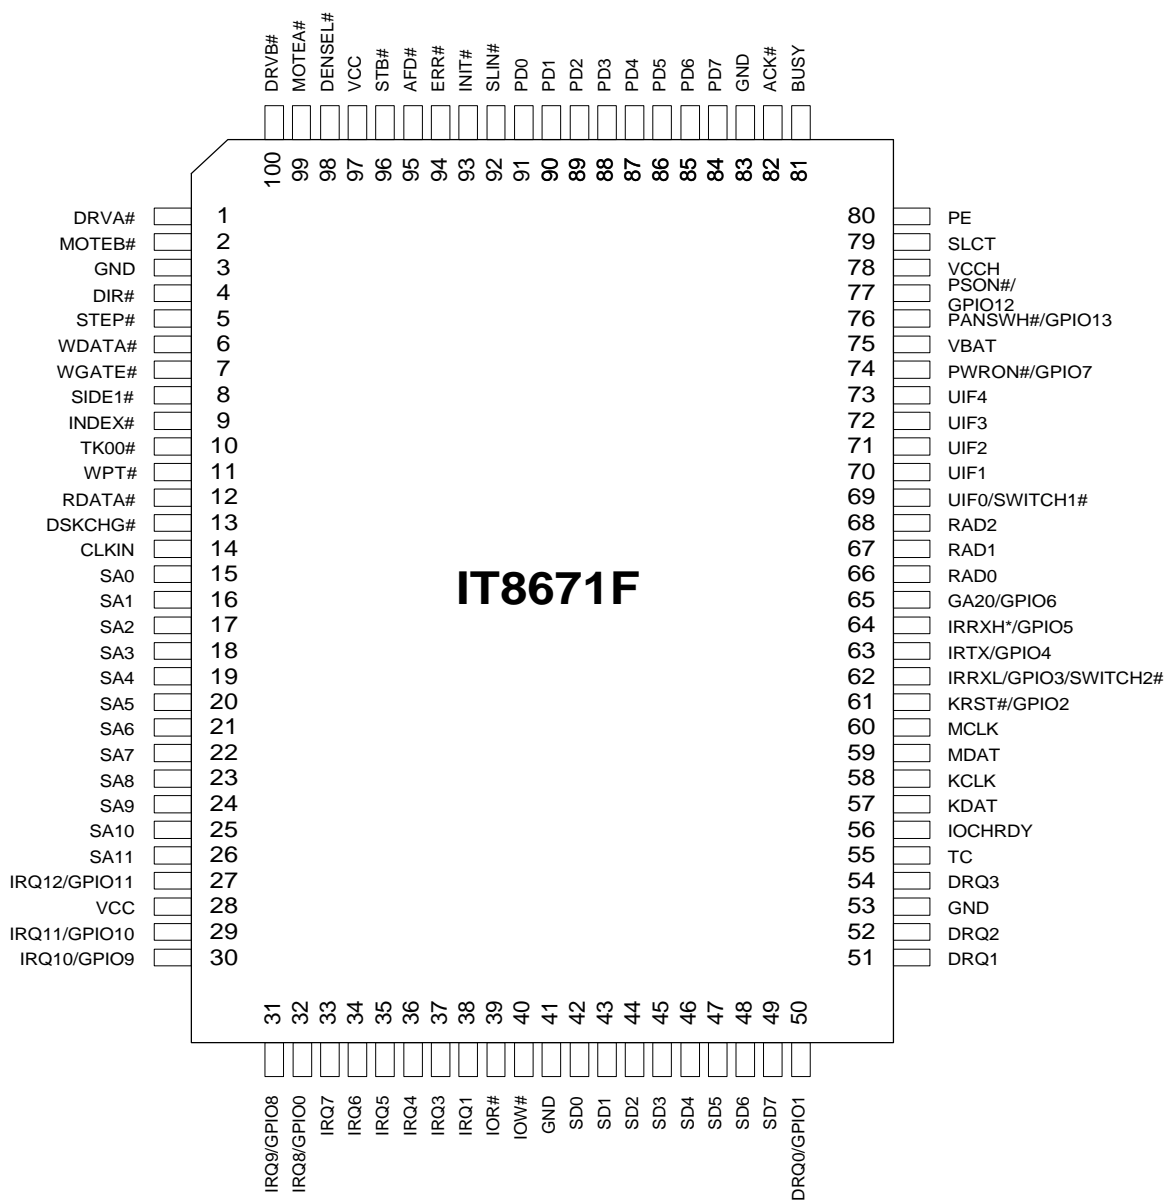

IT8671F Giga I/O is a user friendly, low cost peripheral controller. It provides an ideal solution for the Microsoft® PC97/98 (PC99 ready) system requirements. No N.V. memory is needed to store resource data for Plug and Play system applications.

IT8671F and IT8671RF consist of five logical devices. One high-performance 2.88MB floppy disk controller, with digital data separator, supports two 360K/ 720K/ 1.2M/ 1.44M/ 2.88M floppy disk drives. One multi-mode high-performance parallel port features the bi-directional Standard Parallel Port (SPP), the Enhanced Parallel Port (EPP, v1.7 and v1.9 are supported), and the IEEE1284 compliant Extended Capabilities Port (ECP).

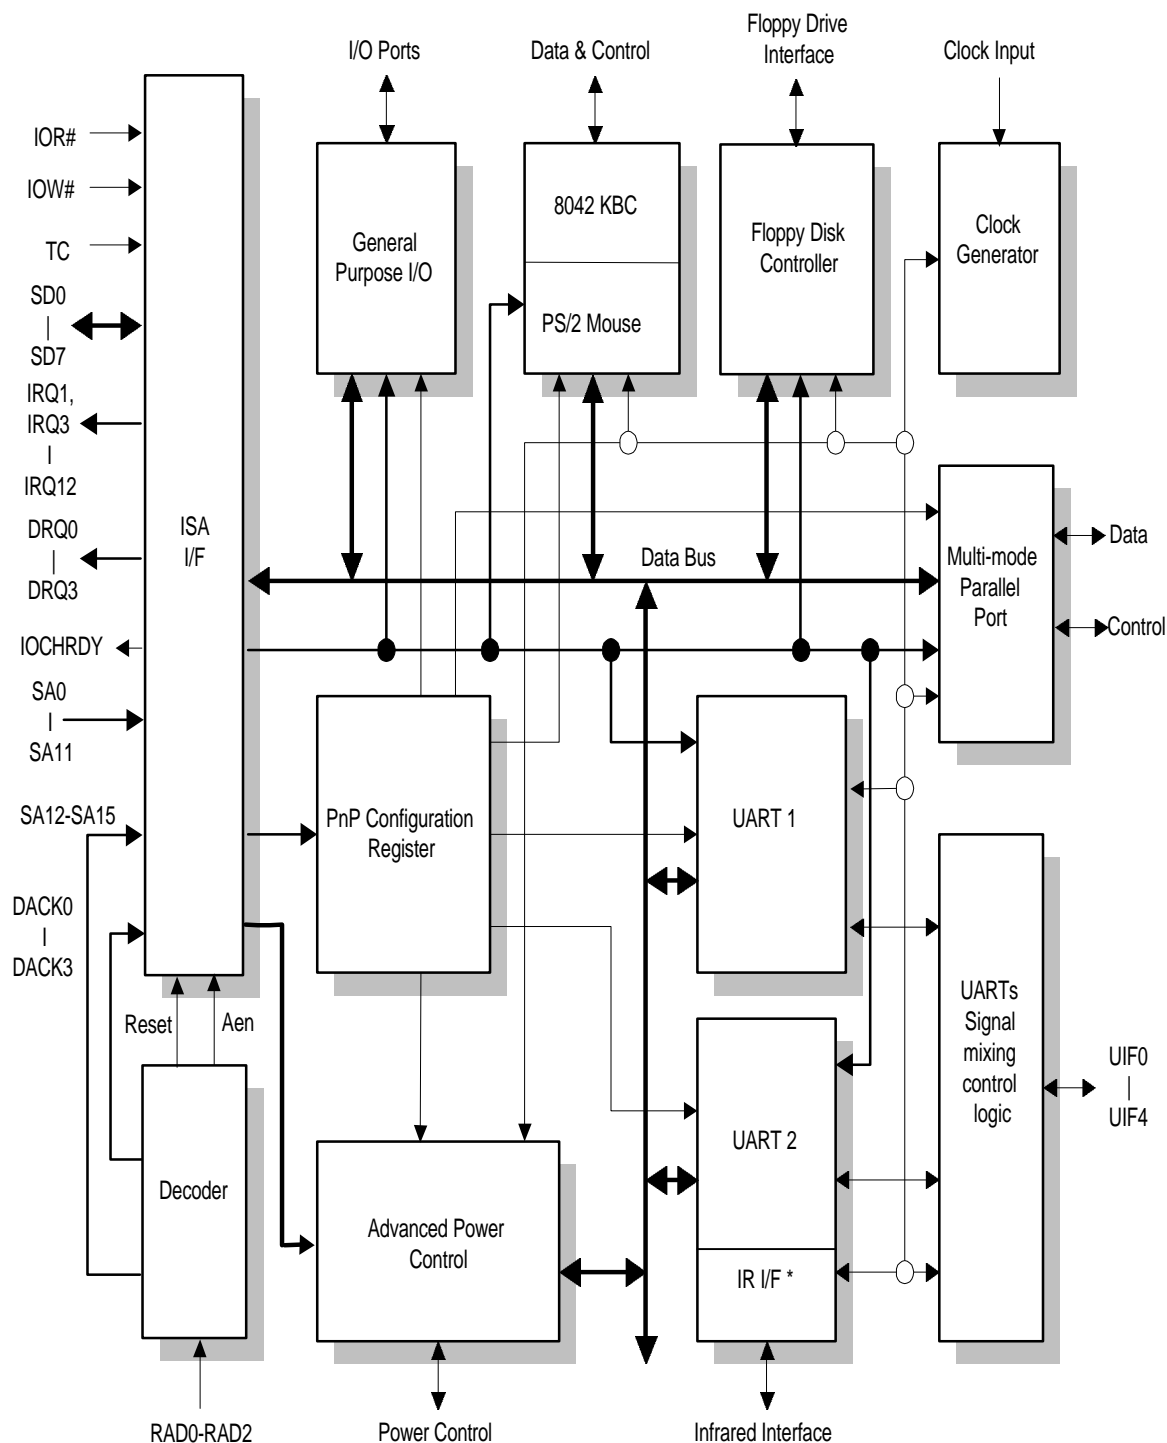

Two 16C550 standard compatible enhanced UARTs perform asynchronous communication with enhanced wireless IrDA1 (HPSIR), MIR, or ASKIR protocols. In addition, there is one 8042 compatible Keyboard controller with 2K programmable ROM for customer specification.

These five logical devices can be individually enabled or disabled via software configuration registers. IT8671F utilizes power-saving circuitry to reduce power consumption. Once a logical device is disabled, the inputs are gated inhibit, outputs are tri-stated, and the input clock is disabled. In effect, IT8671F is high-performance, low power consumption I/O device.

3. Pin Configuration

4. Block Diagram

5. IT8671F Pin Descriptions

Table 5-1. Signal Names (by pin numbers in alphabetical order)

| Pin No. | Signal | I/O | Description |
|---------|--------------|-------|---|
| 1 | DRVA# | O48 | FDD drive A enable, active low |
| 2 | MOTEB# | O48 | FDD Motor B enable, active low |
| 4 | DIR# | O48 | FDC Head Direction, step in when low, step out when high during a SEEK operation |
| 5 | STEP# | O48 | FDC Step pulse output, active low |
| 6 | WDATA# | O48 | FDC Write serial data to the drive, active low |
| 7 | WGATE# | O48 | FDC Write enable identify, active low |
| 8 | SIDE1# | O48 | Floppy disk side 1 select, active low |
| 9 | INDEX# | IS | FDC Index, active low. Indicates the beginning of a disk track. |
| 10 | TK00# | IS | Floppy Disk Track 0, active low. Indicates that the head of the selected drive is on track 0. |
| 11 | WPT# | IS | FDD Write Protect, active low. Indicated that the disk of the selected drive is write-protected. |
| 12 | RDATA# | IS | Read Disk Data, active low, serial data input from FDD |
| 13 | DSKCHG# | IS | Floppy Disk Change, active low. This is an input pin that senses whether the drive door has been opened or a diskette has been changed. |
| 14 | CLKIN | IS | 24/48 MHz Clock Input |
| 15-26 | SA0-11 | IS | ISA I/O Address 0-11 |
| 27 | IRQ12/GPIO11 | I/O24 | Interrupt Request 12. The logical devices of IT8671F can be mapped to individual IRQx via configuration register (0x70). The second function is General Purpose I/O pin 11. |
| 29 | IRQ11/GPIO10 | I/O24 | Interrupt Request 11. The logical devices of IT8671F can be mapped to individual IRQx via configuration register (0x70). The second function is General Purpose I/O pin 10. |
| 30 | IRQ10/GPIO9 | I/O24 | Interrupt Request 10. The logical devices of IT8671F can be mapped to individual IRQx via configuration register (0x70). The second function is General Purpose I/O pin 9. |
| 31 | IRQ9/GPIO8 | I/O24 | Interrupt Request 9. The logical devices of IT8671F can be mapped to individual IRQx via configuration register (0x70). The second function is General Purpose I/O pin 8. |
| 32 | IRQ8/GPIO0 | I/O24 | Interrupt Request 8. The logical devices of IT8671F can be mapped to individual IRQx via configuration register (0x70). The second function is General Purpose I/O pin 0. |
| 33-38 | IRQ7-3,1 | OD24 | Interrupt Requests 7-3, 1. The logical devices of IT8671F can be mapped to individual IRQx via configuration register (0x70). |

Table 5-1. Signal Names (by pin numbers in alphabetical order) [cont' d]

| Pin No. | Signal | I/O | Description |
|--------------|---------------------------|----------------|--|
| 39 | IOR# | IS | Read Strobe, active low |
| 40 | IOW# | IS | Write Strobe, active low |
| 42-49 | SD0-SD7 | I/O24 | 8-bit bi-directional data bus |
| 50 | DRQ0/GPIO1 | OP12/ I/O12 | DMA Request 0. The logical devices of IT8671F can be mapped to individual DRQx by configuration register (0x74). The second function is General Purpose I/O pin 1. |
| 51-52, 54 | DRQ1-3 | OP12 | DMA Request 1, 2, 3. The logical device of IT8671F can be mapped to individual DRQx by configuration register (0x74). |
| 55 | TC | IS | Terminal Count; active high indicates that the data transfer is complete. |
| 56 | IOCHRDY | OD24 | I/O Channel Ready. It extends the READ/WRITE command of the EPP mode operation. |
| 57 | KDAT | I/OD16 | Keyboard data output |
| 58 | KCLK | I/OD16 | Keyboard clock output |
| 59 | MDAT | I/OD16 | PS/2 mouse data output |
| 60 | MCLK | I/OD16 | PS/2 mouse clock output |
| 61 | KRST#/ GPIO2 | I/OD16 | Keyboard reset output. The second function is General Purpose I/O pin 2. |
| 62 | IRRXL/ GPIO3/ SWITCH2# | I/OD8 | Low frequency infrared data stream input. The second function is General Purpose I/O pin 3. / Main power ON-OFF switch input 2 |
| 63 | IRTX/ GPIO4 | I/O16 | Infrared data stream output. The second function is General Purpose I/O pin 4. |
| 64 | IRRXH*/ GPIO5 | I/OD8 | IT8671 function is high frequency infrared data stream input pin. The second function is General Purpose I/O pin 5. |
| 65 | GA20/ GPIO6 | I/OD16 | Gate Address20. The second function is General Purpose I/O pin 6. |
| 66 | RAD0 | IC | ISA signal encoding input pin 0 |
| 67 | RAD1 | IC | ISA signal encoding input pin 1 |
| 68 | RAD2 | IC | ISA signal encoding input pin 2 |
| 69 | UIF0/ SWITCH1# | I/O12 | Serial ports 1,2 TX1, TX2, RTS1, RTS2, DTR1, DTR2 mixing-signal output pin / Main power ON-OFF switch input 1 |
| 70 | UIF1 | IS | Serial port 1 signals RLSD1,RX1,DSR1,CTS1, RI1 mixing-signal input pin. |
| 71 | UIF2 | IS | Serial port 2 signals RLSD2, RX2, DSR2, CTS2, RI2 mixing-signal input pin. |
| 72 | UIF3 | O12 | Serial ports 1,2 transfer cycle indicator |
| 73 | UIF4 | O12 | Serial ports 1,2 signals sample clock output |

Table 5-1. Signal Names (by pin numbers in alphabetical order) [cont' d]

| Pin No. | Signal | I/O | Description |
|--------------|----------------|--------|--|
| 74 | PWRON#/GPIO7 | I/OD16 | Main Power ON-OFF control output. The second function is General Purpose I/O pin 7. |
| 75 | VBAT | | APC backup supply |
| 76 | PANSWH#/GPIO13 | I/OD8 | Panel Switch Input. Main power on-off Switch Input. The pin can be used to resolve auto-booting problem, occurring at the coming of stand-by 5V of ATX power supply, for PIIX4. The second function is General Purpose I/O pin 13. |
| 77 | PSON#/GPIO12 | I/OD8 | Power Supply ON gating output. The pin can be used to resolve auto-booting problem, occurring at the coming of stand-by 5V of ATX power supply, for PIIX4. The second function is General Purpose I/O pin 12. |
| 79 | SLCT | IS | Printer Select. This signal goes high when the line printer has been selected. |
| 80 | PE | IS | Printer Paper End. This signal is set high by the printer when it runs out of paper. |
| 81 | BUSY | IS | Printer Busy. This signal goes high when the line printer has a local operation in progress and cannot accept data. |
| 82 | ACK# | IS | Printer Acknowledge. This signal goes low to indicate that the printer has already received a character and is ready to accept another. |
| 84-91 | PD7-0 | I/O24 | Parallel Port Data Bus. This bus provides a byte-wide input or output to the system. The eight lines are held in a high impedance state when the port is deselected. |
| 92 | SLIN# | O24 | Printer Select Input. When low, the printer is selected. This signal is derived from the complement of bit 3 of the printer control register. |
| 93 | INIT# | O24 | Printer Initialize, active low. This signal is derived from bit 2 of the printer control register, and is used to initialize the printer. |
| 94 | ERR# | IS | Printer Error, when active low it indicates that the printer has encountered an error. The error message can be read from bit 3 of the printer status register. |
| 95 | AFD# | O24 | Printer Auto line feed, active low. This signal is derived from the complement of bit 1 of the printer control register, and is used to advance one line after each line is printed. |
| 96 | STB# | O24 | Printer Strobe, active low. This signal is the complement of bit 0 of the printer control register, and is used to strobe the printing data into the printer. |
| 98 | DENSEL# | O48 | DENSEL# is high for high data rates (500Kbps, 1 Mbps) DENSEL# is low for low data rates (250Kbps, 300Kbps) |
| 99 | MOTEA# | O48 | FDD Motor A enable, active low |
| 100 | DRVB# | O48 | FDD drive B enable, active low |
| 3,41, 53, 83 | GND | | Ground |
| 28,97 | VCC | | +5V power |
| 78 | VCCH | | VCC Help Power; acts as an input pin of power to APC when power supply is plugged in but switched off |

6. Configuring Sequence Description

After the hardware reset or power-on reset, IT8671F enters the normal mode with all logical devices disabled except KBC. The initial state (enable bit) of this logical device is determined by the state of pin UIF4 at the falling edge of the system reset during power-on reset. There are two configuration modes for IT8671F: MB PnP mode and ISA PnP mode.

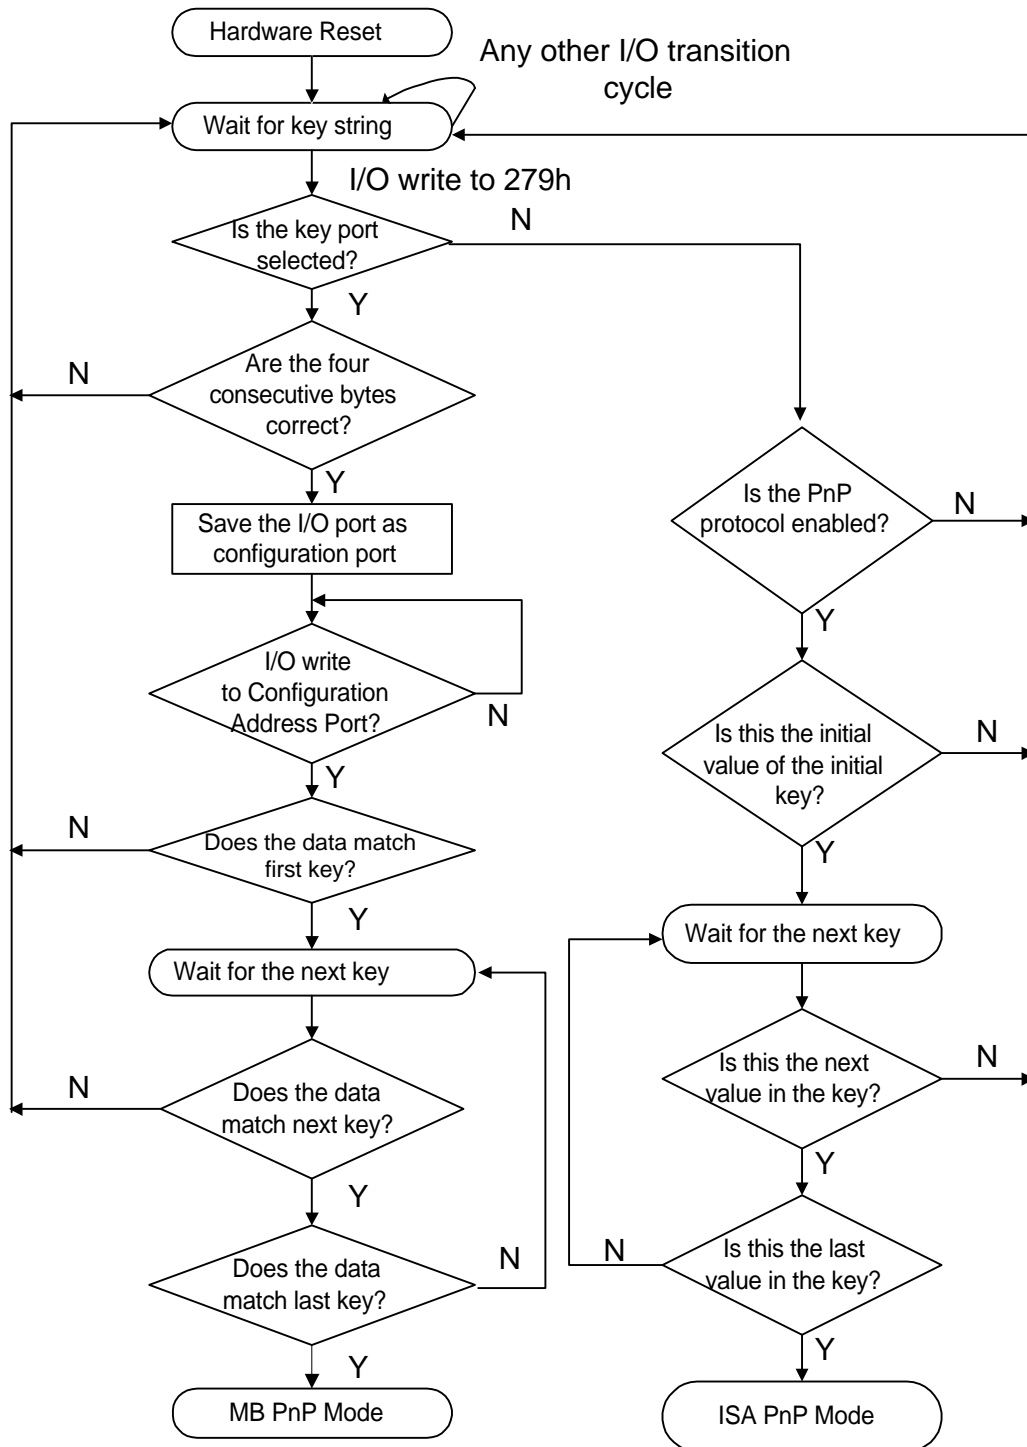

Figure 6-1. Configuration Sequence Flow Chart

6.1 MB PnP Mode

This mode of configuration should be used only when the ITE part is physically soldered to the Motherboard of the system to be configured.

There are three steps to completing the Motherboard mode of configuration. Step one is to enter the MB PnP mode. Step two is modifying the data of configuration registers. Step three is exiting the MB PnP mode. These three steps are explained below. Please note that step three must be followed or an undefined state will occur.

(1) Enter the MB PnP Mode

To enter the MB PnP Mode, 38 specific WRITE operations must be performed during the "Wait for key" state. Please see Figure 6-2 for more information on the "Wait for key" state.

The first two bytes are written to port 279h and determine the I/O address and data port of the configuration registers per the table below.

| | <u>Address port</u> | <u>Data port</u> |
|------------------------|---------------------|------------------|
| 86h, 80h, 55h, 55h; | 3F0h | 3F1h |
| or 86h, 80h, 55h, AAh; | 3BDh | 3BFh |
| or 86h, 80h, AAh, 55h; | 370h | 371h |

The last 32 bytes are written to the I/O port determined by the previous four bytes and are always the same. Once written, the configuration mode has been entered.

Bytes are hex values:

6A, B5, DA, ED, F6, FB, 7D, BE,
DF, 6F, 37, 1B, 0D, 86, C3, 61,
B0, 58, 2C, 16, 8B, 45, A2, D1,
E8, 74, 3A, 9D, CE, E7, 73, 39,

Note that all the above 38 bytes must be written properly and sequentially without disruption. It is therefore strongly suggested that all interrupts be disabled during this WRITE operation.

(2) Modifying the Data of the Configuration Registers

Before accessing a selected register, the content of Index 07h must be changed to the LDN to which the register belongs. This is specifically critical for registers with index 5h, 26h, 2Eh and 2Fh. All registers can be accessed in this mode; however, modifying data of registers marked "ISA PNP" in this specification will cause undesired results.

(3) Exiting the MB PnP Mode

Set bit 1 of the configure control register (Index 02h) to "1" to exit the MB PnP Mode.

6.2 ISA PnP Mode

This mode is ISA PnP standard compliant. (Please refer to Plug and Play, ISA Spec. V1.0A for detailed descriptions). In this mode, only some configuration registers of this chip can be accessed. The enable register for the PnP logical device must be asserted prior to entering the MB PnP Mode. Since the LDNs are dynamic, users can assign logical devices to be configured by ISA Plug and Play V1.0a protocol since they always remain enabled in PC systems and thus utilize fixed resources.

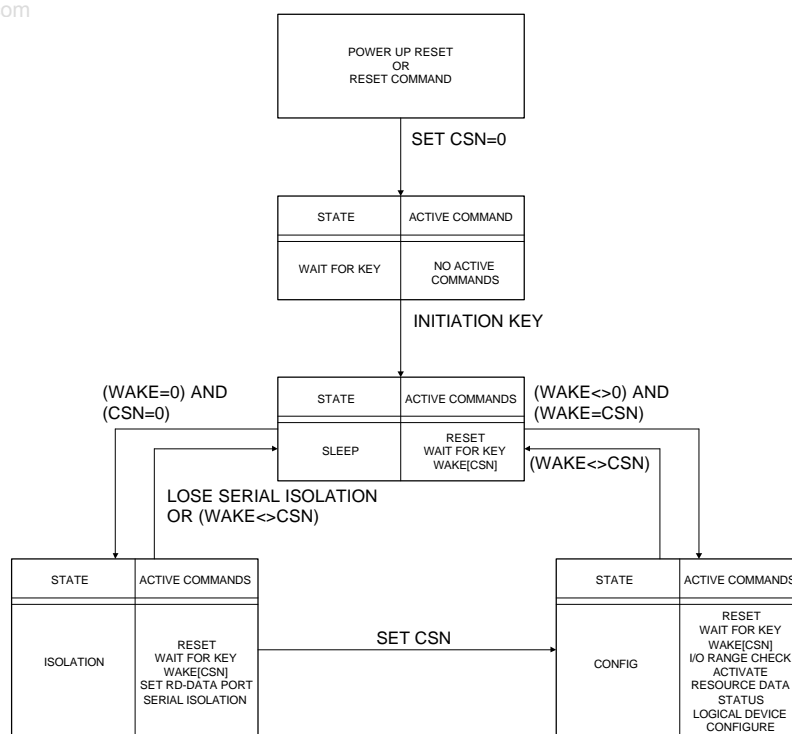

Figure 6-2. PnP State Transition

6.2.1 Plug and Play Operation Sequence

Refer to Figure 6-2, the PnP State Transition. Here is an example of a procedure to be followed for IT8671F setup. It is optional and not the only sequence of events that may occur. For any state and at any time, all valid commands can be received and followed with a proper feedback response.

- At power up or when the RESET signal is activated:
 - The Card Select Number (CSN) is set to "0X00".
 - All configuration registers for logical devices are set to their internal power-on default values.
- The Linear Feedback Shift Register (LFSR) is reset to its initial state (0X6A).
- Entering the "Wait for Key" state. IT8671F enters this state within 1.5ms after RESET signal or RESET command.

The initiation key is written to IT8671F. Each value of the initiation key is calculated after shifting the LFSR by one clock for each write, and the written data is compared with the calculated (expected) data. In this state, the chip will reset the LFSR to "0X6A" whenever it receives a write from the address port that does not match the current value in the LFSR.

- Once the initiation key is correctly received, the chip enters "Sleep" state (the auto-configuration ports are enabled).
- The system sends a WAKE[CSN=0] command to switch the chip into "Isolation" state.
- The system sets the RD_DATA port to an arbitrary address.
- The system performs the isolation protocol by sending a sequence of 72 pairs of I/O READ operations. (Refer to Hardware Protocol in ISA PnP Specification V1.0a.)

- h. Provided that IT8671F passes the isolation protocol, the system sets the CSN to a non-zero value (assigned OUR_CSN) and IT8671F enters the "Configuration" state.
- i. The system reads the resource data from IT8671F.
- j. The system switches IT8671F into the "Sleep" state by sending a "Wake" command with a CSN that is different from OUR_CSN. When IT8671F is in "Sleep" state, the system can perform operations from other Plug and Play chips.
- k. The system sends a "WAKE[OUR_CSN]" command; IT8671F returns to the "Configuration" state.
- l. The system sets the logical device information and activates each of the logical devices.
- m. The system sends other commands.
- n. The system sends a "Wait for Key" command; IT8671F returns to

the "Wait for Key" state (the auto-configuration ports are disabled).

Notes:

- * At power-on or when the RESET signal is activated, go to Step a.
- ** When a Wait for "Key command" is received, go to Step b.

6.3 Description of the Configuration Registers

All the registers will be reset to the default state when RESET is activated. When the RESET command is asserted (configure control bit 0), the test registers and the registers which can be accessed during the ISA PnP mode, will be reset to their initial values (default values) in either the ISA PnP mode or the MB PnP mode; while the others (cannot be accessed during the ISA PnP mode) will be reset to the default values only in the MB PnP mode. Other registers, with Index=22h, 23h, 24h, or 25h and APC registers, are reset by the RESET command.

| | | |
|---------------------------|---------|------------|
| <u>Configuration Port</u> | 0X0279H | write-only |
| <u>Write-data Port</u> | 0X0A79H | write-only |

Notes:

*1: Under the ISA PnP mode, the LDNs are dynamic.
For example: When the enable register (index 23h) of a PnP logical device contains 0Fh (i.e. FDC, Serial Port 1, 2 & Parallel Port are enabled); by LDN mapping, 00h represents FDC; 01h, Serial Port 1; 02h, Serial Port 2; and 03h, Parallel Port. When 06h is given to the register index 23h (only Serial Port 1, 2), by LDN mappings, 00h stands for Serial Port 1; and 01h, for Serial Port 2.

*2: All these registers can be read from all LDNs.

*3: When the ECP mode is not enabled, this register is read-only as "04h", and cannot be written.

*4: When bit 2 of the base address of Parallel Port is set to 1, the EPP mode cannot be enabled. Bit 0 of this register is always 0.

*5: The initial value of the activate bit of KBC is determined by the latched state of UIF4 at the falling edge of the RESET signal.

*6: These registers are read-only unless the write enable bit (index F0h) is asserted.

6.3.1 Logical Device Base Address

The base I/O range of logical devices shown below is stored in the built-in resource data ROM; PnP BIOS or OS will read this data from the resource data ROM to locate the

base I/O address range of each logical device. If any I/O port conflicts should occur, the PnP OS will automatically re-allocate one of the conflicting ports within the base I/O range.

Table 6-10. Base Address of Logical Devices

| Logical Devices | Base I/O Range | Fixed Base Offsets |
|------------------------|---|---|
| LDN=0 FDC | [0X0100:0X0FF8] ON 8-BYTE BOUNDARIES | +2H : DOR +4H : MSR/DSR +5H : FIFO +7H : DIR/DCR |
| LDN=1 SERIAL PORT 1 | [0X0100:0X0FF8] ON 8-BYTE BOUNDARIES | +0H : RBR/TBR/DLL div +1H : IER/DLM div +2H : IIR/FCR +3H : LCR +4H : MCR +5H : LSR +6H : MSR +7H : SCR |
| LDN=2 SERIAL PORT 2 | [0X0100:0X0FF8] ON 8-BYTE BOUNDARIES | +0H : RBR/TBR/DLL div +1H : IER/DLM div +2H : IIR/FCR +3H : LCR +4H : MCR +5H : LSR +6H : MSR +7H : SCR |
| LDN=3 PARALLEL PORT | [0X0100:0X0FFC] ON 8-BYTE BOUNDARIES (EPP mode supported) or ON 4-BYTE BOUNDARIES (EPP mode not supported) [0X0100:0X0FF8] ON 4-BYTE BOUNDARIES | +0H : DATA/ecpAfifo +1H : STATUS +2H : CONTROL +3H : EPP address +4H : EPP data 0 +5H : EPP data 1 +6H : EPP data 2 +7H : EPP data 3 +0H : cfifo/ecpDfifo/cnfgA +1H : cnfgB +2H : ecr |

6.4 Global Configuration Registers (LDN : All)

6.4.1 Set RD_DATA Port (Index=00h, ISA PnP)

Writing to this location modifies the address of the port used for reading from the ISA Plug and Play cards. Bits[7:0] are mapped as bits[9:2] of I/O READ port. The I/O READ port address bits[1:0] is always "11b." This register is write-only and is only used in the ISA PnP mode. It cannot be written in the MB PnP mode.

6.4.2 Serial Isolation (Index=01h, ISA PnP)

A read from this register results in a switch to the "Isolation" state for the Plug and Play card, and then a comparison with one bit of the card ID. This register is read-only, and only used in the ISA PnP mode.

6.4.3 Configure Control (Index=02h, ISA PnP/MB PnP)

This register is write-only. Its values are not sticky; that is to say, a hardware reset will automatically clear the bits, and does not require the software to clear them.

| Bit | Description |
|-----|--|
| 7-3 | Reserved |
| 2 | Reset CSN to 0. This bit is only used in the ISA PnP mode, and should not be written "1" in the MB PnP mode. |
| 1 | Return to the "Wait for Key" state. This bit is used for both the ISA PnP and MB PnP modes when configuration sequence is completed. |
| 0 | Reset all logical devices and restore configuration registers to their power-on states. In the ISA PnP mode, writing "1" to this bit only resets those registers that can be accessed in the ISA PnP mode. |

6.4.4 Wake[CSN] (Index=03h, ISA PnP)

Writing to this port will assign all cards with a CSN to go from the "Sleep" state to either the Isolation state (if data[7:0]=00h) or the Configuration state (if data[7:0]≠00h), if the CSN matches the write data [7:0]. This register is write-only, and only used in the ISA PnP mode.

6.4.5 Resource Data (Index=04h, ISA PnP)

This register is read-only and only used in the ISA PnP mode.

6.4.6 Status (Index=05h, ISA PnP)

Bits[7:1] are reserved. By setting bit 0, it indicates ready to fetch the next data byte from the Resource Data register.

6.4.7 Card Select Number (CSN, Index=06h, Default=00h, ISA PnP)

Upon writing to this register, a card's CSN is given. CSN is a value uniquely assigned to each ISA card after the serial identification process, so that each card may be individually selected during a Wake [CSN] command. This register is READ/WRITE, and only used in the ISA PnP mode.

6.4.8 Logical Device Number (LDN, Index=07h, ISA PnP/MB PnP)

This register is used to select the current logical devices. By reading from or writing to the configuration of I/O, Interrupt, DMA and other special functions, all registers of the logical device can be accessed. In addition, the I/O Range Check and Activate commands are effective only on the selected logical devices. This register is READ/WRITE and used in both the ISA PnP and MB PnP modes.

6.4.9 Chip ID Byte 1 (Index=20h, Default=86h, MB PnP)

This register is the Chip ID Byte 1 and for read only. Bits [7:0]=86h when read.

www.DataSheet4U.com

6.4.10 Chip ID Byte 2 (Index=21h, Default=81h, MB PnP)

This register is the Chip ID Byte 2 and for read only. Bits [7:0]=81h when read.

6.4.11 Chip Version (Index=22h, Default=00h, MB PnP)

This register is the Chip Version and for read only.

6.4.12 PnP Logical Device Enable Register (Index=23h, Default=00h, MB PnP)

The logical devices will not be involved in the ISA PnP protocol sequence except when the enable bits of the PnP logical devices are set.

| Bit | Description |
|-----|---------------|
| 7 | Reserved |
| 6 | KBC Mouse |
| 5 | KBC Keyboard |
| 4 | Reserved |
| 3 | Parallel Port |
| 2 | Serial Port 2 |
| 1 | Serial Port 1 |
| 0 | FDC |

In the ISA PnP mode, the LDNs are dynamic. The default sequence is FDC, Serial Port 1, Serial Port 2, Parallel Port, KBC Keyboard and KBC Mouse. If one of the bits is not set, the corresponding LDNs of the devices after this current one are subtracted by 1. For example: when 0Fh is given to bits[7:0] (PnP logical device enable : FDC, Serial Ports 1, 2 & Parallel Port). By LDN mapping, we will get 00h as FDC, 01h as Serial Port 1, 02h as Serial Port 2, and 03h as Parallel Port. When 06h is given to bits[7:0] (only Serial Port 1, 2). By LDN mapping, we take 00h as Serial Port 1 and 01h as Serial Port 2.

6.4.13 Software Suspend (Index=24h, Default=00h, MB PnP)

This register is the Software Suspend register. When bit 0 is set, IT8671F is in the "Software Suspend" states. All the devices, except KBC, remain inactive until this bit is cleared or the wake-up event occurs. The wake-up event occurs at any transition on signals RI1 (pin 37) and RI2 (pin 32) of the transceiver chip IT8687R.

| Bit | Description |
|-----|---------------------------------------|
| 7 | Reserved |
| 6 | CLKIN Selection 1: 48MHz 0: 24MHz |
| 5 | Reserved |
| 4 | Parallel Port smart power down enable |
| 3 | Serial Port 2 smart power down enable |
| 2 | Serial Port 1 smart power down enable |
| 1 | FDC smart power down enable |
| 0 | Software Suspend |

6.4.14 GPIO[11:8] Function Enable Register (Index=25h, Default=00h, MB PnP)

Bits [7:4] are mapped as the GPIO[11:8] Function enable register. If the enable bits are not set, the multi-function pins will perform the original functions. If set, they will perform the GPIO functions. Bits [3:0] are reserved and should be written 0. This register can be read from any LDN but can only be written if LDN=07h.

| Bit | Description |
|-----|-----------------------------------|
| 7 | Enables GPIO Function 11 (pin 27) |
| 6 | Enables GPIO Function 10 (pin 29) |
| 5 | Enables GPIO Function 9 (pin 30) |
| 4 | Enables GPIO Function 8 (pin 31) |
| 3-0 | Reserved |

www.DataSheet4U.com

6.4.15 GPIO[7:0] Function Pin Enable Register (Index=26h, Default=00h, MB PnP)

This register is GPIO[7:0] Function Enable Register. If the enable bits are not set, the multi-function pins will perform the original functions. If set, they will perform the GPIO functions. This register can be read from any LDN, but can only be written if LDN=07h.

| Bit | Description |
|-----|----------------------------------|
| 7 | Enables GPIO Function 7 (pin 74) |
| 6 | Enables GPIO Function 6 (pin 65) |
| 5 | Enables GPIO Function 5 (pin 64) |
| 4 | Enables GPIO Function 4 (pin 63) |
| 3 | Enables GPIO Function 3 (pin 62) |
| 2 | Enables GPIO Function 2 (pin 61) |
| 1 | Enables GPIO Function 1 (pin 50) |
| 0 | Enables GPIO Function 0 (pin 32) |

6.4.16 Reserved Register (Index=2Eh, Default= 00h, MB PnP)

This register is reserved for testing purposes or other future uses. It can be read from any LDN, but can only be written when LDN=F4h.

6.4.17 Test Enable Register[7:0] (Index=2Fh, Default=00h, MB PnP)

This register is the Test Enable Register [7:0]. It should not be set except for manufacture testing. This register can be read from any LDN, but can be only written on the LDN=F4h.

6.5 FDC Configuration Registers (LDN=00h)

6.5.1 FDC Activate (Index=30h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-1 | Reserved |
| 0 | FDC Enable 1: enable 0: disable This is a READ/WRITE register. I/O Range Check must be disabled before it is to be set active. |

6.5.2 FDC I/O Range Check (Index=31h, Default =00h, ISA PnP)

This register is used in the ISA PnP mode to perform a conflict check on the I/O port range programmed for FDC.

| Bit | Description |
|-----|--|
| 7-2 | Reserved |
| 1 | Enable I/O Range Check. If set, I/O Range Check is then enabled. FDC must be inactive before it is to be set. |
| 0 | If set, IT8671F is forced to respond with a "55h" to I/O READ of the assigned I/O range of FDC when I/O Range Check is in operation. If cleared, it then sends an "AAh" in response. |

6.5.3 FDC Base Address MSB Register (Index= 60h, Default=03h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Read-only, with "0h" for Base Address [15:12] |
| 3-0 | Mapped as Base Address [11:8] |

6.5.4 FDC Base Address LSB Register (Index=61h, Default=F0h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | READ/WRITE, mapped as Base Address[7:3] |
| 2-0 | Read-only as "000b" |

6.5.5 FDC Interrupt Level Select (Index=70h, Default=06h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Reserved with default "0h" |
| 3-0 | Select the interrupt level for FDC Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

www.DataSheet4U.com

6.5.6 FDC Interrupt Type (Index=71h, Default=02h, ISA PnP)

This register indicates the type of interrupt used for FDC, and is read-only as default "02h" (to indicate the traditional interrupt type, edge trigger).

6.5.7 FDC DMA Channel Select (Index=74h, Default=02h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | Reserved with default "00h" |
| 2-0 | Select the DMA channel for FDC 7h-5h : not valid 4h : no DMA channel selected 3h : DMA3 2h : DMA2 1h : DMA1 0h : DMA0 |

6.5.8 FDC Special Configuration Register (Index=F0h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Reserved with default "00h" |
| 3 | 1 : IRQ sharing 0 : Normal IRQ |
| 2 | 1 : Swap Floppy Drives A, B 0 : Normal |
| 1 | 1 : 3-mode 0 : AT mode |
| 0 | 1 : Software Write Protect 0 : Normal |

6.6 Serial Port 1 Configuration Registers (LDN=01h)

6.6.1 Serial Port 1 Activate (Index=30h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-1 | Reserved |
| 0 | Serial Port 1 Enable 1: enable 0: disable This is a READ/WRITE register. I/O Range Check must be disabled before it is to be set active. |

6.6.2 Serial Port 1 I/O Range Check (Index=31h, Default=00h, ISA PnP)

This register is used in the ISA PnP mode to perform a conflict check on the I/O port range programmed for Serial Port 1.

| Bit | Description |
|-----|--|
| 7-2 | Reserved with default "00h" |
| 1 | I/O Range Check 1 : enable 0 : disable Serial Port 1 must be inactive before it is to be set. |
| 0 | If set, IT8671F is forced to respond with a "55h" to I/O READ of the assigned I/O range of Serial Port 1 when I/O Range Check is in operation. If cleared, it then sends an "AAh" in response. |

6.6.3 Serial Port 1 Base Address MSB Register (Index=60h, Default=03h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Read-only as "0h" for Base Address[15:12] |
| 3-0 | READ/WRITE, mapped as Base Address[11:8] |

6.6.4 Serial Port 1 Base Address LSB Register (Index=61h, Default=F8h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | READ/WRITE, mapped as Base Address[7:3] |
| 2-0 | Read-only as "000b" |

6.6.5 Serial Port 1 Interrupt Level Select (Index =70h, Default=04h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Reserved with default "0h" |
| 3-0 | Select the interrupt level for Serial Port 1 Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

www.DataSheet4U.com

6.6.6 Serial Port 1 Interrupt Type (Index=71h, Default=02h, ISA PnP)

This register indicates the type of interrupt used for Serial Port 1, and is read-only as 02h (to indicate the traditional interrupt type, edge trigger).

6.6.7 Serial Port 1 Special Configuration Register (Index=F0h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7-2 | Reserved with default "00h" |
| 1 | 1 : IRQ sharing 0 : normal |
| 0 | 1 : MIDI support enabled 0 : MIDI support disabled |

6.7 Serial Port 2 Configuration Registers (LDN=02h)

6.7.1 Serial Port 2 Activate (Index=30h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-1 | Reserved |
| 0 | Serial Port 2 Enable 1: enable 0: disable This is a READ/WRITE register. I/O Range Check must be disabled before it is to be set active. |

6.7.2 Serial Port 2 I/O Range Check (Index=31h, Default=00h, ISA PnP)

This register is used in the ISA PnP mode to perform a conflict check on the I/O port range programmed for Serial Port 2.

| Bit | Description |
|-----|--|
| 7-2 | Reserved with default "00h" |
| 1 | I/O Range Check 1 : enable 0 : disable Serial Port 2 must be inactive before it is to be set. |
| 0 | If set, IT8671F is forced to respond with a "55h" to I/O READ of the assigned I/O range of Serial Port 2 when I/O Range Check is in operation. If cleared, it then sends an "AAh" in response. |

6.7.3 Serial Port 2 Base Address MSB Register (Index=60h, Default=02h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Read-only with "0h" for Base Address[15:12] |
| 3-0 | READ/WRITE, mapped as Base Address[11:8] |

6.7.4 Serial Port 2 Base Address LSB Register (Index=61h, Default=F8h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | READ/WRITE, mapped as Base Address[7:3] |
| 2-0 | Read-only as "000b" |

6.7.5 FIR Base Address MSB Register (Index=62h, Default=03h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Read-only with "0h" for Base Address[15:12] |
| 3-0 | READ/WRITE, mapped as Base Address[11:8] |

6.7.6 FIR Base Address LSB Register (Index=63h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | READ/WRITE, mapped as Base Address[7:3] |
| 2-0 | Read-only as "000b" |

6.7.7 Serial Port 2 Interrupt Level Select (Index=70h, Default=03h, ISA PnP/MB PnP)

| Bit | Description |
|-----|--|
| 7-4 | Reserved with default "0h" |
| 3-0 | Select the interrupt level for Serial Port 2 Fh-Dh : not valid Ch : IRQ12 . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

www.DataSheet4U.com

6.7.8 Serial Port 2 Interrupt Type (Index=71h, Default=02h, ISA PnP)

This register indicates the type of interrupt used for Serial Port 2, and is read-only as "02h" (to indicate the traditional interrupt type, edge trigger).

6.7.9 FIR Interrupt Level Select(Index =72h, Default=0Ah, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Reserved with default "0h" |
| 3-0 | Select the interrupt level for Serial Port 2 Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

6.7.10 FIR Interrupt Type (Index=73h, Default=02h, ISA PnP)

This register is available for IT8671RF only and indicates the type of interrupt used for Serial Port 2, and is read-only as "02h" (to indicate the traditional interrupt type, edge trigger).

6.7.11 FIR DMA Channel Select 1 (Index=74h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | Reserved with default "00h" |
| 2-0 | Select the DMA channel for FDC 7h-5h : not valid 4h : no DMA channel selected 3h : DMA3 2h : DMA2 1h : DMA1 0h : DMA0 |

6.7.12 FIR DMA Channel Select 2 (Index=75h, Default=01h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | Reserved with default "00h" |
| 2-0 | Select the DMA channel for FDC 7h-5h : not valid 4h : no DMA channel selected 3h : DMA3 2h : DMA2 1h : DMA1 0h : DMA0 |

6.7.13 Serial Port 2 Special Configuration Register 1 (Index=F0h, Default=00h, MB PnP)

The Secondary IRRXL input is used to change the IR Receive low frequency input to any GPIO when the original pin (PIN 62) is used as SWITCH2#.

| Bit | Description |
|-----|---|
| 7-4 | Secondary IRRXL input Location ^{Note} |
| 3-2 | Reserved with default "00h" |
| 1 | 1 : IRQ sharing 0 : normal |
| 0 | 1 : MIDI support enabled 0 : MIDI support disabled |

6.7.14 Serial Port 2 Special Configuration Register 2 (Index=F1h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7 | 1: 40 bits time-out when TX → RX in Half Duplex mode 0: no time-out when TX → RX in Half Duplex mode |
| 6 | Reserved |

6.8 Parallel Port Configuration Registers (LDN=03h)

6.8.1 Parallel Port Activate (Index=30h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-1 | Reserved |
| 0 | Parallel Port 1 Enable 1: enable 0: disable This is a READ/WRITE register. I/O Range Check must be disabled before it is to be set active. |

6.8.2 Parallel Port I/O Range Check (Index=31h, Default=00h, ISA PnP)

This register is used in the ISA PnP mode to perform a conflict check on the I/O port range programmed for Parallel Port.

| Bit | Description |
|-----|--|
| 7-2 | Reserved |
| 1 | I/O Range Check 1 : enable 0 : disable Parallel Port must be inactive before it is to be set. |
| 0 | If set, IT8671F is forced to respond with a "55h" to I/O READ of the assigned I/O range of Parallel Port when I/O Range Check is in operation. If cleared, it then sends an "AAh" in response. |

6.8.3 Parallel Port Primary Base Address MSB Register (Index=60h, Default=03h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Read-only as "0h" for Base Address[15:12] |
| 3-0 | READ/WRITE, mapped as Base Address[11:8] |

6.8.4 Parallel Port Primary Base Address LSB Register (Index=61h, Default=78h, ISA PnP/MB PnP)

If bit 2 is set to 1, the EPP mode is disabled automatically.

| Bit | Description |
|-----|---|
| 7-2 | READ/WRITE, mapped as Base Address[7:2] |
| 1-0 | Read-only as "00b" |

6.8.5 Parallel Port Secondary Base Address MSB Register (Index=62h, Default=07h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Read-only as "0h" for Base Address[15:12] |
| 3-0 | READ/WRITE, mapped as Base Address[11:8] |

6.8.6 Parallel Port Secondary Base Address LSB Register (Index=63h, Default=78h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-2 | READ/WRITE, mapped as Base Address[7:2] |
| 1-0 | Read-only as "00b" |

6.8.7 Parallel Port Interrupt Level Select (Index =70h, Default=07h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Reserved with default "0h" |
| 3-0 | Select the interrupt level for Parallel Port Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

www.DataSheet4U.com

6.8.8 Parallel Port Interrupt Type (Index=71h, Default=02h, ISA PnP)

This register indicates the type of interrupt used for the Parallel Port, and is read-only as "02h" (to indicate the traditional interrupt type, edge trigger).

6.8.9 Parallel Port DMA Channel Select (Index= 74h, Default=03h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | Reserved with default "00h" |
| 2-0 | Select the DMA channel for Parallel Port 7h-5h : not valid 4h : No DMA channel selected 3h : DMA3 2h : DMA2 1h : DMA1 0h : DMA0 |

6.8.10 Parallel Port Special Configuration Register (Index=F0h, Default=03h, MB PnP)

| Bit | Description |
|-----|--|
| 7-3 | Reserved |
| 2 | 1 : IRQ sharing 0 : normal |
| 1-0 | Parallel Port mode 00 : Standard Parallel Port mode (SPP) 01 : EPP mode 10 : ECP mode 11 : EPP mode & ECP mode |

If bit 1 is set, ECP mode is enabled. If bit 0 is set, EPP mode is enabled. These two bits are independent. However, according to the EPP spec., when Parallel Port Primary Base Address bit 2 is set to 1, the EPP mode cannot be enabled.

6.9 APC Configuration Registers (LDN=04h)

6.9.1 Reserved Register(Index=30h, Default=00h, ISA PnP/MB PnP)

This register is reserved and should be given "00h".

6.9.2 APC Configuration Register 1 (Index=F0h, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7 | It is set to 1 when VCCH is off, cleared by writing a "1" to this bit, and ineffective after a "0" is written to this bit. |
| 6 | Pulse mode on pin PWRON# 1 : PWRON# output low Pulse 0 : PWRON# output low level |
| 5 | Software Power Off command, write-only and non-sticky. 1 : PWRON# output signal is deactivated 0 : No effect |
| 4 | Mask PWRON# Activation 1 : Masks PWRON# activation except Switch On event 0 : No effect |
| 3 | POR# Enable/Level Type POR# clear 1 : Enable POR# function and clear level type POR# 0 : No effect |
| 2 | POR# Edge/Level Type Selection 1 : Level 0 : Edge |
| 1 | Switch Off Delay Time 1 : 21 seconds 0 : 5 seconds |
| 0 | PS/2 mouse wake-up mode 1 : Special key 0 : Edge |

6.9.3 APC Configuration Register 2 (Index=F1h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7 | Reserved |
| 6 | Switch Off Delay Enable 1: After Switch Off event occurs, PWRON# output is deactivated after 5 or 21 seconds delay. 0: PWRON# output is deactivated immediately after Switch Off. |

www.DataSheet4U.com

6.9.3 APC Configuration Register 2(cont'd) (Index=F1h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 5 | RI2 Active Enable 1: A low to high transition in RI2 pin of IT8687R activates PWRON# output pin except bit 4 of APC Configuration Register 1 is set. 0 : No effect |
| 4 | RI1 Active Enable 1: A low to high transition on RI1 pin of IT8687R activates PWRON# output pin except when bit 4 of APC Configuration Register 1 is set. 0 : No effect |
| 3 | RING# Active Enable 1: RING# Detection activates PWRON# output pin except when bit 4 of APC Configuration Register 1 is set. 0 : No effect |
| 2 | RING# Detection Pulse/Train Type selection 1 : Detection pulse/train > 16Hz for 0.19 seconds 0 : Detection of pulse falling edge |
| 1 | Keyboard Active Enable 1: Keyboard Detection activates PWRON# output pin except when bit 4 of APC Configuration Register1 is set. 0 : No effect |
| 0 | PS/2 Mouse Active Enable 1: PS/2 Mouse Detection activates PWRON# output pin except when bit 4 of APC Configuration Register1 is set. 0 : No effect |

6.9.4 APC Status Register (Index=F2h, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7 | Keyboard Detection 1: Keyboard Detection has occurred regardless of the Keyboard Detection Enable bit since the last READ of this register. 0 : No effect |
| 6 | Hold Switch Off Delay Timer 1: Hold Switch Off Delay Timer until this bit is cleared. It is self-clearing when the power is switched from VCCH to VCC. 0 : No effect |
| 5 | Switch Off Event 1 : Switch Off event occurred and has been detected 0 : no Switch Off Event occurred |
| 4 | VCC state when VCCH is off 1 : VCC is on when VCCH is off 0 : VCC is off when VCCH is off |
| 3 | RI2 Detection 1 : RI2 Detection has occurred regardless of the RI2 Detection Enable bit since the last READ of this register 0 : No effect |
| 2 | RI1 Detection 1 : RI1 Detection has occurred regardless of the RI1 Detection Enable bit since the last READ of this register 0 : No effect |
| 1 | RING# Detection 1 : RING# Detection has occurred regardless of the RI2 Detection Enable bit since the last READ of this register 0 : No effect |
| 0 | PS/2 Mouse Detection 1: PS/2 Mouse Detection has occurred regardless of the PS/2 Mouse Detection Enable bit since the last READ of this register. 0 : No effect |

www.DataSheet4U.com

6.9.5 APC Special Control Register 4 (Index=F4h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7 | Reserved |
| 6 | Keyboard Type, selecting the code of "ENTER" and "Backspace" 1 : XT type Keyboard 0 : AT type Keyboard |
| 5 | PSON# state when VCCH is switched from OFF to ON |
| 4 | Mask PANSWH# power-on |
| 3-2 | Key Number of the Keyboard power-up event 00: 5 (Key string mode), 3(Stroke keys at same time mode). 01: 4 (Key string mode), 2(Stroke keys at same time mode). 10: 3 (Key string mode), 1(Stroke keys at same time mode). 11: 2 (Key string mode), Reserved (Stroke keys at same time mode). |
| 1-0 | Keyboard power-up event mode selection 00: KCLK falling edge 01: Key string mode. 10: Stroke keys at same time mode. 11: Reserved |

6.9.6 APC Special Control Register 5 (Index=F5h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7-3 | Reserved |
| 2-0 | Indicate which Identification Key Code register is to be read/written via 0xF6. |

6.9.7 APC Special Control Register 6 (Index=F6h, MB PnP)

There are 5 bytes for Key String mode and 3 bytes for Stroke Keys at same time mode.

6.10 KBC (keyboard) Configuration Registers (LDN=05h)

6.10.1 KBC (keyboard) Activate (Index=30h, Default=01h or 00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|--|
| 7-1 | Reserved |
| 0 | KBC Enable 1: enable 0: disable This is a READ/WRITE register. I/O Range Check must be disabled before it is to be set active. The default value depends on the state of the UIF4 when RESET is activated. It is 01h for the High state of UIF4 when RESET is activated. It is 00h for the low state of UIF4 when RESET is activated. |

6.10.2 KBC(keyboard) I/O Range Check (Index=31h, Default=00h, ISA PnP)

This register is used in the ISA PnP mode to perform a conflict check on the I/O port range programmed for KBC (keyboard).

| Bit | Description |
|-----|--|
| 7-2 | Reserved |
| 1 | I/O Range Check 1 : enable 0 : disable KBC must be inactive before it is to be set. |
| 0 | If set, IT8671F is forced to respond with a "55h" to I/O READ of the assigned I/O range of KBC when I/O Range Check is in operation. If cleared, it then sends an "AAh" in response. |

6.10.3 KBC (keyboard) Data Base Address MSB Register (Index=60h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|--|
| 7-4 | Read-only as "0h" for Base Address [15:12] |
| 3-0 | READ/WRITE, mapped as Base Address [11:8] |

www.DataSheet4U.com

6.10.4 KBC (keyboard) Data Base Address LSB Register (Index=61h, Default=60h, PnP ISA/MB PnP)

| Bit | Description |
|-----|---|
| 7-0 | READ/WRITE, mapped as Base Address[7:0] |

6.10.5 KBC (keyboard) Command Base Address MSB Register (Index=62h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Read-only as "0h" for Base Address[15:12] |
| 3-0 | READ/WRITE, mapped as Base Address[11:8] |

6.10.6 KBC (keyboard) Command Base Address LSB Register (Index=63h, Default=64h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-0 | READ/WRITE, mapped as Base Address[7:0] |

6.10.7 KBC (keyboard) Interrupt Level Select (Index=70h, Default=01h, ISA PnP/MB PnP)

| Bit | Description |
|-----|--|
| 7-4 | Reserved with default "0h" |
| 3-0 | Select the interrupt level for KBC (keyboard) Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

6.10.8 KBC (keyboard) Interrupt Type (Index=71h, Default=02h, ISA PnP)

This register indicates the type of interrupt used for KBC (keyboard) and is read-only as "02h" when bit 1 of the KBC (keyboard) Special Configuration Register is cleared. If set, this type of interrupt can be selected as level or edge trigger.

| Bit | Description |
|-----|------------------------------|
| 7-2 | Reserved |
| 1 | 1 : High Level 0 : Low Level |
| 0 | 1 : Level Type 0 : Edge Type |

6.10.9 KBC (keyboard) Special Configuration Register (Index=F0h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7 | Reserved |
| 6 | Reserved |
| 5 | Reserved |
| 4 | 1 : IRQ sharing 0 : normal |
| 3 | 1 : KBC input clock 8MHz 0 : KBC input clock 12MHz |
| 2 | 1 : Key lock enable 0 : Key lock disable |
| 1 | 1: Type of interrupt of KBC (keyboard) can be changed. 0: Type of interrupt of KBC (keyboard) is fixed |
| 0 | 1 : Enables the External Access ROM of 8042 0 : Internal built-in ROM is used |

www.DataSheet4U.com

6.11 KBC (mouse) Configuration Registers (LDN=06h)

6.11.1 KBC (mouse) Activate (Index=30h, Default=00h, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-1 | Reserved |
| 0 | KBC Enable 1: enable 0: disable This is a READ/WRITE register. I/O Range Check must be disabled before it is to be set active. |

6.11.2 KBC (mouse) Interrupt Level Select (Index=70h, Default=0Ch, ISA PnP/MB PnP)

| Bit | Description |
|-----|---|
| 7-4 | Reserved with default "0h" |
| 3-0 | Select the interrupt level for KBC (mouse) Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

6.11.3 KBC (mouse) Interrupt Type (Index=71h, Default=02h, ISA PnP)

This register indicates the type of interrupt used for KBC (mouse) and is read-only as "02h" when bit 0 of the KBC (mouse) Special Configuration Register is cleared. When bit 0 is set, the type of interrupt can be selected as level or edge trigger.

| Bit | Description |
|-----|---------------------------------|
| 7-2 | Reserved |
| 1 | 1 : High Level 0 : Low Level |
| 0 | 1 : Level Type 0 : Edge Type |

6.11.4 KBC(mouse) Special Configuration Register (Index=F0h, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7-2 | Reserved with default "00h" |
| 1 | 1 : IRQ sharing 0 : normal |
| 0 | 1: Type of interrupt of KBC (mouse) can be changed. 0: Type of interrupt of KBC (mouse) is fixed. |

6.12 GPIO & Alternate Function Configuration Registers (LDN=07h)

6.12.1 CS0 Base Address MSB Register (Index=60h, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7-4 | Read-only as "0h" for Base Address [15:12] |
| 3-0 | READ/WRITE, mapped as Base Address [11:8] |

6.12.2 CS0 Base Address LSB Register (Index=61h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7-0 | READ/WRITE, mapped as Base Address[7:0] |

6.12.3 CS1 Base Address MSB Register (Index=62h, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7-4 | Read-only as "0h" for Base Address [15:12] |
| 3-0 | READ/WRITE, mapped as Base Address [11:8] |

6.12.4 CS1 Base Address LSB Register (Index=63h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7-0 | READ/WRITE, mapped as Base Address[7:0] |

6.12.5 CS2 Base Address MSB Register (Index=64h, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7-4 | Read-only as "0h" for Base Address [15:12] |
| 3-0 | READ/WRITE, mapped as Base Address [11:8] |

www.DataSheet4U.com
**6.12.6 CS2 Base Address LSB Register
(Index=65h, Default=00h, MB PnP)**

| Bit | Description |
|-----|---|
| 7-0 | READ/WRITE, mapped as Base Address[7:0] |

**6.12.7 Simple I/O Base Address MSB Register
(Index=66h, Default=00h, MB PnP)**

| Bit | Description |
|-----|---|
| 7-4 | Read-only as "0h" for Base Address[15:12] |
| 3-0 | READ/WRITE, mapped as Base Address[11:8] |

**6.12.8 Simple I/O Base Address LSB Register
(Index=67h, Default=00h, MB PnP)**

| Bit | Description |
|-----|---|
| 7-0 | READ/WRITE, mapped as Base Address[7:0] |

**6.12.9 Reserved Register (Index=68h,
Default=00h, MB PnP)**
**6.12.10 Reserved Register (Index=69h,
Default=00h, MB PnP)**
**6.12.11 GPIO Interrupt Steering 1 Control
Register (Index=70h, Default=00h, MB
PnP)**

| Bit | Description |
|-----|--|
| 7-4 | Please see Pin Location ^{note} on page 31. |
| 3-0 | Select the interrupt level for GPIO Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

**6.12.12 GPIO Blinking Control Register
(Index=71h, Default=00h, MB PnP)**

| Bit | Description |
|-----|---|
| 7-6 | Serves to control the frequency selection. 00 : 16Hz 01 : 4Hz 10 : 1Hz 11 : 1/4Hz |
| 5 | Reserved |
| 4-1 | Please see Pin Location ^{note} on page 31. |
| 0 | Reserved |

**6.12.13 GPIO Interrupt Steering 2 Control
Register (Index=72h, Default=00h, MB
PnP)**

| Bit | Description |
|-----|--|
| 7-4 | Please see Pin Location ^{note} on page 31. |
| 3-0 | Select the interrupt level for GPIO Fh-Dh : not valid Ch : IRQ12 . . 3h : IRQ3 2h : not valid 1h : IRQ1 0h : no interrupt selected |

**6.12.14 Reserved Register (Index=73h,
Default=00h, MB PnP)**

This register is reserved for future use.

**6.12.15 GPIO[7:0] Pin Polarity Register
(Index=F0h, Default=00h, MB PnP)**

This register is used to program the GPIO [7:0] pin type as polarity inverting or non-inverting for GPIO [7:0].

| Bit | Description |
|-----|---|
| 7-0 | For each bit 1 : inverting 0 : non-inverting |

www.DataSheet4U.com

6.12.16 CS0/CS1/CS2 Control Register (Index=F1h/F2h/F3h, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7-6 | Base Address Alignment 00 : single port 01 : 2 ports 10 : 4 ports 11 : 8 ports |
| 5-4 | Chip Select Type 00 : Pure Address Decode 01 : Address Decode and IOR command 10 : Address Decode and IOW command 11 : Address Decode and (IOR or IOW command) |
| 3-0 | Please see Location ^{note} on page 31. |

6.12.17 GPIO[7:0] Function Selection Register (Index=F4h, Default=00h, MB PnP)

This register is used to select the function as to be either the Simple I/O or the Alternate function.

| Bit | Description |
|-----|---|
| 7-0 | For each bit 1 : Simple I/O 0 : Alternate function |

6.12.18 Simple I/O[7:0] Direction Selection Register (Index=F5h, Default=00h, MB PnP)

This register is used to determine the direction of the Simple I/O.

| Bit | Description |
|-----|--|
| 7-0 | For each bit 1 : Input mode 0 : Output mode |

6.12.19 Zero Wait State Control & GPIO IRQ Sharing Enable Register (Index=F6h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7 | GPIO Interrupt steering 2 IRQ sharing enable |
| 6 | GPIO Interrupt steering 1 IRQ sharing enable |
| 5-4 | Reserved |
| 3-0 | Please see Location ^{note} on page 31. |

6.12.20 Zero Wait State Device Enable Register (Index=F7h, Default=00h, MB PnP)

This register is used to determine which device is enabled in the ZWS function.

| Bit | Description |
|-----|---|
| 7 | GPIO (Simple I/O, CS0, CS1, CS2) |
| 6 | KBC |
| 5 | Reserved |
| 4 | EPP Address and Data Port (Parallel Port Primary Base Address + 3h~7h) |
| 3 | SPP & ECP Port(Parallel Port Primary Base Address + 0~2h & Secondary Base Address + 0~2h) |
| 2 | Serial Port 2 |
| 1 | Serial Port 1 |
| 0 | FDC |

6.12.21 GPIO[11:8] Pin Polarity Register (Index=F8h, Default=00h, MB PnP)

This register is used to program the GPIO [11:8] pin type as polarity inverting or non-inverting for GPIO [11:8].

| Bit | Description |
|-----|---|
| 7-4 | Reserved |
| 3-0 | For each bit 1 : inverting 0 : non-inverting |

www.DataSheet4U.com

6.12.22 GPIO[11:8] Function Selection Register (Index=F9h, Default=00h, MB PnP)

This register is used to select the function to be either the Simple I/O or Alternate function.

| Bit | Description |
|-----|---|
| 7-4 | Reserved |
| 3-0 | For GPIO[11:8] 1 : Simple I/O 0 : Alternate function |

6.12.23 Simple I/O[11:8] Direction Selection Register (Index=FAh, Default=00h, MB PnP)

This register is used to determine the direction of the Simple I/O [11:8].

| Bit | Description |
|-----|--|
| 7-4 | Reserved |
| 3-0 | For each bit 1 : Input mode 0 : Output mode |

6.12.24 APC POR# & RING# Pin Select Register (Index=FBh, Default=00h, MB PnP)

This register is used to program the Pin location of POR# & RING# of APC function.

| Bit | Description |
|-----|--|
| 7 | Reserved |
| 6-4 | Location of RING# 000 : None 010 : GPIO 2 (pin 61) 011 : GPIO 3 (pin 62) 100 : GPIO 4 (pin 63) 101 : GPIO 5 (pin 64) 110 : GPIO 6 (pin 65) 001 : GPIO 12 (pin 77) 111 : GPIO 13 (pin 76) else : Reserved |
| 3-0 | Location of POR# 0000 : None 0001 : GPIO 0 (pin 32) 0011 : GPIO 1 (pin 50) 0101 : GPIO 2 (pin 61) 0111 : GPIO 3 (pin 62) 1001 : GPIO 4 (pin 63) 1011 : GPIO 5 (pin 64) 1101 : GPIO 6 (pin 65) 1111 : GPIO 7 (pin 74) 0010 : GPIO 8 (pin 31) 0100 : GPIO 9 (pin 30) 0110 : GPIO 10 (pin 29) 1000 : GPIO 11 (pin 27) 1010 : GPIO 12 (pin 77) 1100 : GPIO 13 (pin 76) else : Reserved |

6.12.25 Reserved Registers (Index=FCh/FDh/FEh, Default=00h, MB PnP)

These registers are reserved for future use.

6.12.26 Keyboard Lock Input Control Register (Index=FFh, Default=00h, MB PnP)

| Bit | Description |
|-----|--|
| 7-6 | Reserved |
| 5 | Selection 1 : Input from the pin location defined by bit[3:0] 0 : Share with GPIO Interrupt Steering 1 |
| 4 | Reserved |
| 3-0 | Keyboard Location. Please see Location ^{note} on page 31. |

6.12.27 SMI Enable Register 1 (Index=E0h, Default=00h, MB PnP)

This register is used to enable different interrupt sources onto the GPIO SMI output.

| Bit | Description |
|-----|--|
| 7 | Enables GPIO Interrupt Steering 1 onto SMI |
| 6 | Enables KBC(Mouse) IRQ onto SMI |
| 5 | Enables KBC(Keyboard) IRQ onto SMI |
| 4 | Reserved |
| 3 | Enables Parallel Port IRQ onto SMI |
| 2 | Enables Serial Port 2 IRQ onto SMI |
| 1 | Enables Serial Port 1 IRQ onto SMI |
| 0 | Enables FDC IRQ onto SMI |

6.12.28 SMI Enable/Control Register 2 (Index=E1h, Default=00h, MB PnP)

| Bit | Description |
|-----|---|
| 7 | Reserved |
| 6-3 | SMI pin location. Please see Location ^{note} on page 31. |
| 2 | SMI output type select 1 : Level 0 : Edge |
| 1 | Enables Bottom Switch onto SMI |
| 0 | Enables GPIO Interrupt Steering 2 onto SMI |

6.12.29 SMI Status Register 1 (Index=E2h, Default=00h, MB PnP)

This register is used to read the status of the SMI Source. These bits are automatically cleared when the corresponding source events become invalidated. These bits will also be cleared by writing 1 to bit 7 of SMI Status Register 2, no matter the events of the corresponding sources are invalidated or not.

| Bit | Description |
|-----|---------------------------|
| 7 | GPIO Interrupt Steering 1 |
| 6 | KBC(Mouse) IRQ |
| 5 | KBC(Keyboard) IRQ |
| 4 | Reserved |
| 3 | Parallel Port IRQ |
| 2 | Serial Port 2 IRQ |
| 1 | Serial Port 1 IRQ |
| 0 | FDC IRQ |

6.12.30 SMI Status Register 2 (Index=E3h, Default=00h, MB PnP)

This register is used to read the status of the SMI Source. These bits are automatically cleared when the corresponding source events become invalidated. These bits will also be cleared by writing 1 to bit 7 of this register, no matter the events of the corresponding sources are invalidated or not.

| Bit | Description |
|-----|--|

7. Functional Description

7.1 General Purpose I/O

IT8671F provides a set of flexible I/O control and special functions for the system designers via a set of General Purpose I/O pins (GPIO). All twelve GPIO pins are multi-functional. They will not perform GPIO functions unless the bits of the GPIO function pin enable register (Index 25h & 26h of Global Configuration Register) are set. GPIO function includes the simple I/O function and the alternate function.

The Simple I/O function includes a set of registers, which correspond to the GPIO pins. All control bits are divided into two registers (Simple I/O 1, GPIO [7:0]; Simple I/O 2, GPIO [11:8]). The accessed I/O ports are programmable and are two consecutive I/O ports (Base Address & Base Address+1). Base Address is programmed on the registers of GPIO Alternate Function (LDN=07h, Index=66h & 67h). There are two bits in the register (Index F6h, LDN 07h), which can control the I/O ports of the Simple I/O 1 & 2. If bit 4 of the register 'F6h' is set, the Base Address serves as a single port. Bit 5 of the register is used to determine Simple I/O 1 or Simple I/O 2 used under this condition.

The Alternate Function provides several special functions for users, including three chip select strobes (CS0, CS1, CS2), Zero Wait State, Interrupt steering, Power Off Request, RING (the last two are sub-functions of APC) and SMI/SCI output. All these functions can be programmed to all twelve GPIO pins, except the RING function. Three registers should be programmed to enable an alternate function, Index 26h (or 25h) and F4h (or F9h) or LDN 07h and pin location bits of each alternate function.

IT8671F provides flexible control registers related to each of the three chip select strobes (Index F1h, F2h, F3h, LDN 07h). Each one can be programmed as 1 or 2 or 4 or 8 via consecutive I/O ports decoding. It can also be programmed to qualify with IOR# and IOW# states. There are four types of qualifying conditions: pure address decided,

asserted on address matching and IOR# asserted, asserted on address matching and IOW# asserted, asserted on address matching and IOR# or IOW# asserted.

The Key Lock function locks the keyboard to invalidate any key stroke. The programming method is to set bit 3 on the register Index F0h of KBC (keyboard). The pin location mapping, Index 70h must also be programmed correctly.

The Zero Wait State function is used to reduce the cycle time of the ISA bus when IT8671F is accessed. IT8671F provides a set of enable registers for the logical devices that are activated with Zero Wait State function when they are accessed. By programming this register, users can select the logical devices that are fast enough to set the Zero Wait State of the ISA bus.

The Interrupt steering function provides a useful feature for motherboard designers. Through this mapping, the interrupt of other on-board devices can be easily changed through software. The programming method is to set the related bits on the register Index 26h (or 25h), F4h (or F9h) and F5h (or FAh). The pin location mapping, Index 70h or 72h must also be programmed correctly.

The POR# and RING# are sub-functions of the APC. POR# is an output function and RING# is an input function. The programming method of POR# or RING# is similar to that of Zero Wait State or the chip select strobe.

The Blinking function provides a low frequency blink output. It can be used to connect to a power LED. There are several frequencies that can be selected.

The SMI is non-maskable interrupt used for transparent power management. It consists of different enable interrupts from each of the functional blocks in IT8671F. The interrupts are enabled onto the SMI output via the SMI enable register 1 and SMI enable/control register 2. The SMI status registers 1 and 2 are used to read the status of the SMI input events. All the SMI status register bits can be

www.DataSheet4U.com

cleared when the corresponding sources events become invalidated. These bits can also be cleared by writing 1 to bit 7 of SMI status register 2, no matter the events of the corresponding sources are invalidated or not. The SMI can be programmed as pulse mode or level mode whenever a SMI event occurs. The logic equation of the SMI event is described below:

SMI event = (EN_FIRQ and FIRQ) or (EN_S1IRQ and S1IRQ) or (EN_S2IRQ and S2IRQ) or (EN_PIRQ and PIRQ) or (EN_KBC(Keyboard) and KIRQ) or (EN_KBC(Mouse) and MIRQ) or (EN_GPIRQ1 and GPIRQ1) or (EN_GPIRQ2 or GPIRQ2) or (EN_BTN and BTN^{Note})

Note: BTN stands for Bottom Switch.

Figure 7-1. General Logic of GPIO Function

7.2 Advanced Power Supply Control

The circuit for advanced power supply control (APC) provides three power states to power up or power off the main power supply of the system.

1. ON: VCC & VCCH are supplied.
2. OFF: main power off and only VCCH is supplied (the standby power).
3. Fail: main power off and the standby power is not supplied also.

If the power-on events occur, the signal PWRON# is activated and the main power supply is switched on. If the power-off events occur, the signal PWRON# is deactivated and the system is switched off.

Power ON events are (When power OFF state):

1. Low to high transition on input pins RI1 and RI2 of IT8687R.
2. Detection of RING# pulse or pulse train on the programmed RING# input pin.
3. Switch ON event detected on the SWITCH1# or SWITCH2# (It is determined by the state of the UIF1 when RESET is activated that SWITCH1# or SWITCH2# is used.)
4. Detection of the active edge on pin KCLK or MCLK. It can be also programmed to detect double click mouse key.

Power OFF events are (When power ON state):

1. Switch OFF event is detected on the SWITCH1# input pin (UIF0) or SWITCH2#.
2. Software control via bit 5 of Index F0h, LDN 04h.

One debounce circuit is built into the SWITCH1#/SWITCH2# input pin to detect the switch on event. The switch on event is not validated unless the SWITCH1#/SWITCH2# input pin has been kept low for at least 16ms. The switch off event is also not validated unless the SWITCH1# input pin has been kept low for at least 16ms. The switch off event on SWITCH2# is kept low for at least 4s. However, keeping SWITCH2# under 4s will generate an SMI or SCI, if the related enabled bits are enabled.

The RING# function is used to power on the system from modem, fax, etc. It can be programmed to detect a pulse train with pulse low.

The switch off delay is used for the system to maintain the power until the on-going tasks are completed when the Switch Off event occurs. The switch off delay time can be selected as 5 or 21 seconds. The switch off delay timer can be held off within the counting range (set bit 6 of Index F2h, LDN 04h). This bit provides more flexible switch off delay time.

The Mask PWRON# Activation bit is used to mask all Power ON events except Switch on event when the power state just switches from FAIL to OFF. In other words, when this bit is set and the power state just switches from FAIL to OFF, the only available power-on event is Switch On event.

7.2.1 PANSWH# and PSON#

The PANSWH# and PSON# are especially designed for PIIX4. PANSWH# serves as a main power switch input which is wire-AND to the APC output PWRON#. PSON# is the register bit (LDN=04h, index F4h, bit 5) output when the VCCH is switched from OFF to ON. When it is active (output low), it is not de-active until PANSWH# is active. PSON# is a special design used for SUSC gating of PIIX4 when VCCH is switched from OFF to ON.

7.3 FDC Register Description

7.3.1 Digital Output Register (DOR) - (Base Address + 02h)

This register controls drive selection and drive motor. The I/O interface reset may be used at any time to clear DOR's contents.

Table 7-1. Digital Output Register (DOR)

| Bit | Symbol | Description |
|-----|---------|---|
| 7 | - | Reserved |
| 6 | - | Reserved |
| 5 | MOTB EN | Drive B Motor Enable bit, active high |
| 4 | MOTA EN | Drive A Motor Enable bit, active high |
| 3 | DMAEN | Disk Interrupt and DMA Enable bit, active high |
| 2 | RESET# | FDC Function Reset bit, active low. This reset doesn't affect DSR, CCR and DOR. |
| 1 | - | Reserved |
| 0 | DVSEL | Drive Selection. When it is low, select drive A. When it is high, select drive B. |

7.3.2 Main Status Register (MSR) - (Base Address + 04h)

This register indicates the disk controller status. It should be read before each byte is sent to or received from the data register, except when in DMA mode.

Table 7-2. Main Status Register (MSR)

| Bit | Symbol | Description |
|-----|--------|--|
| 7 | RQM | Request for Master When this bit is set to high, the host can transfer data. |
| 6 | DIO | Data Input/Output bit Indicates the direction of data transfer once a RQM is set. Logic 1 = READ. Logic 0 = WRITE. |
| 5 | NDM | Non-DMA Mode Active high. This bit is used with the SPECIFY command. |
| 4 | CB | Diskette Control Busy It is set active (high) during the execution of a command, and inactive (low) at the end of the result phase. |
| 3 | - | Reserved |
| 2 | - | Reserved |
| 1 | DBB | Drive B Busy It is set high when drive B is in the SEEK portion of a command. |
| 0 | DAB | Drive A Busy It is set high when drive A is in the SEEK portion of a command. |

7.3.3 Data Register (FIFO) - (Base Address + 05h)

This 8-bit data register actually consists of several registers in a stack, and only one register is presented to the data bus at a time when storing data commands and parameters, or providing diskette-drive status information.

7.3.4 Digital Input Register (DIR) - (Base Address + 07h)

Table 7-3. Digital Input Register (DIR)

| Bit | Symbol | Description |
|-----|--------|---|
| 7 | DSKCHG | Diskette Change bit Indicates the inverting value of the bit monitored from the input of the Diskette Change pin (DSKCHG#) |
| 6-0 | | Undefined, high-impedance while being read |

7.3.5 Diskette Control Register (DCR) - (Base Address + 07h Write)

The transfer rate register is a 2-bit, read-only register which controls a programmable divider and provides 16/8/4.8/4 MHz clocks for four various data transfer rates. The bits are defined below:

Table 7-4. Diskette Control Register (DCR)

| Bit 0 | Bit 1 | Transfer Rates | Clock Rates | Reduce Write |
|-------|-------|----------------|-------------|--------------|
| 0 | 0 | 500K bps | 8 MHz | 0 |
| 1 | 0 | 300K bps | 4.8 MHz | 1 |
| 0 | 1 | 250K bps | 4 MHz | 1 |
| 1 | 1 | 1M bps | 16 MHz | 1 |

7.3.6 Status Register

These 4-byte read-only registers indicate the status of some determined commands that have been executed during their result phase. Their contents are described in the tables below:

Table 7-5. Status Register 0

| Bit | Symbol | Name | Description |
|------|--------|-----------------|--|
| 7, 6 | IC | Interrupt Code | 00 – Execution of the command is completed and correct. 01 – Execution of the command has begun, but failed to complete successfully. 10 – INVALID command 11 - The execution of the command is not correctly completed, caused by polling. |
| 5 | SE | Seek End | The FDC executes a SEEK, RELATIVE SEEK or RE-CALIBRATE command. |
| 4 | EC | Equipment Check | The TRK00# pin cannot be active after a RE-CALIBRATE command is issued, or when the FDC steps outward beyond track 0 with a relative command. |
| 3 | NR | Not Ready | |
| 2 | H | Head Address | The current head address |
| 1 | DSB | Drive B Select | Selects drive B |
| 0 | DSA | Drive A Select | Selects drive A |

Table 7-6. Status Register 1

| Bit | Symbol | Name | Description |
|-----|--------|----------------------|--|
| 7 | EN | End of Cylinder | FDC attempts to access a sector beyond the final sector of the track. If TC is not issued after READ or WRITE DATA commands, it will be set. |
| 6 | - | - | Unused, always 0 |
| 5 | DE | Data Error | A CRC error occurs in the ID field or the data field is detected by FDC. |
| 4 | OR | Overflow/ Underrun | Overflow on a READ operation or Underrun on a WRITE operation is caused by an insufficient time interval for the CPU or DMA to service the FDC. |
| 3 | - | - | This bit is always "0." |
| 2 | ND | No Data | <ol style="list-style-type: none"> 1. FDC cannot find the indicated sector while the READ DATA or READ DELETED DATA Commands are executed. 2. While executing a READ ID Command, an error occurs upon reading the ID field. 3. While executing a READ A TRACK Command, the FDC cannot find the starting sector. |
| 1 | NW | Not Writeable | Activated when a WRITE or FORMAT Command is being executed on a WRITE-protected diskette. |
| 0 | MA | Missing Address Mark | <ol style="list-style-type: none"> 1. The FDC cannot find a data address mark on the specified track or Deleted Data Address mark. 2. The FDC cannot find any ID address on the specified track after two index pulses are detected from the INDEX # pin. |

Table 7-7. Status Register 2

| Bit | Symbol | Name | Description |
|-----|--------|---------------------------|---|
| 7 | - | - | Unused, this bit is always "0". |
| 6 | CM | Control Mark | When the FDC finds a Delete Data Address mark with a READ DATA or SCAN command, this flag bit is set. |
| 5 | DD | Data Error in Data Field | When a CRC error is found in the data field, this flag bit is set. |
| 4 | WC | Wrong Cylinder | The track address in the ID field is different from the track address specified in the FDC. |
| 3 | SH | Scan Equal Hit | When the condition of "equal" is satisfied with a SCAN command, this flag bit is set. |
| 2 | SN | Scan Not Satisfied | When FDC cannot find a sector on the cylinder with a SCAN command, this flag bit is set. |
| 1 | BC | Bad Cylinder | The track address FFh is different from the track address in the FDC. |
| 0 | MD | Missing Data Address Mark | The Data Address Mark or Deleted Data Address Mark cannot be found by the FDC. |

Table 7-8. Status Register 3

| Bit | Symbol | Name | Description |
|-----|--------|---|---|
| 7 | FT | Fault | The status of the Fault signal from the FDD |
| 6 | WP | Write Protect | The status of the Write Protect signal from the FDD |
| 5 | RDY | Ready | The status of the Ready signal from the FDD |
| 4 | TK0 | Track 0 | The status of the Track 0 signal from the FDD |
| 3 | TS | Two Side | The status of the Two Side signal from the FDD |
| 2 | HD | Head Address | The status of the Side Select signal to the FDD |
| 1 | US1 | Unit Select. Indicates the current status of the Unit Select signals to FDD | |
| 0 | US0 | | |

7.3.7 Reset

IT8671F implements two types of reset on FDC: software and hardware. Either way will perform FDC reset, releasing the FDC to idle state. While the FDC writes to the disk, the action of performing a RESET will cause the corruption of data and CRC.

(1) Hardware Reset (Reset Pin)

With this RESET, all registers of the FDC CORE are cleared (except those programmed by the SPECIFY Command). To exit the RESET state, the DOR bit must be cleared by the host.

(2) Software Reset (DOR reset and DSR reset)

The discrepancy between DOR and DSR is that DSR is self-cleared, while DOR must be cleared by the host to exit the RESET state. The DOR RESET has higher priority than the DSR RESET.

7.3.8 Controller Phases

The FDC supplies three controller phases: Command Phase, Execution Phase and Result Phase.

(1) Command Phase

When FDC accepts a command from the host before the end of this phase, a set of command-code bytes and parameter bytes has to be given in the order that the FDC requires. The FDC READ step is enabled only

if MSR(7)=1 and MSR(6)=0 (RQM and DIO bit). RQM is set false after each byte-READ cycle, and set true again when a new parameter byte is required, continuing in the READ state while the READ step remains zero.

(2) Execution Phase

This phase can be completed by the SPECIFY command in DMA or NON-DMA modes. Through the CONFIGURE command, FIFO can be automatically enabled and disabled after each RESET.

(3) Result Phase

This phase begins when the IRQx pin is activated. The defined set of result bytes must be read by the Host before this phase can be completed. Before the FDC starts to read data, RQM and DIO must be set high. When the READ step ends, RQM=1, DIO=0, and CB bit is cleared.

7.3.9 Data Transfer Commands Description

All DATA TRANSFER Commands utilize the same parameter bytes and return the same result data byte, differentiating between them only in the five bits (0~4) of the first byte. By sending a CONFIGURE Command, the user transparent implied SEEK can be enabled. During the execution of the SEEK, the Drive Busy bit in MSR is active. The Status Register 0 will contain the error code, and the current cylinder will be indicated by the symbol "C" when the SEEK fails.

Table 7-9. Command Symbol Description

| Symbol | Name | Description |
|---------------------------------|-------------------------|--|
| A ₀ | Address Line 0 | A ₀ controls selection of Main Status Register (A ₀ =0) or Data Register (A ₀ =1). |
| C | Cylinder Number | C stands for the current/selected Cylinder (track) Number 0 through 76 or the medium. |
| D | Data | D stands for the data pattern to be written into a sector. |
| D ₇ - D ₀ | Data Bus | Eight-bit Data Bus, where D ₇ stands for the most significant bit, and D ₀ stands for the least significant bit. |
| DTL | Data Length | When N is defined as 00, DTL stands for the Data Length which users are going to read out or write into the Sector. |
| EOT | End of Track | EOT stands for the final Sector number on a Cylinder. During a READ or WRITE operation, FDC stops data transfer after a sector # equal to EOT. |
| GPL | Gap Length | GPL stands for the length of Gap 3. During READ/WRITE commands, this value determines the number of bytes that VCOs will stay low after two CRC bytes. During a FORMAT command, it determines the size of Gap 3. |
| H | Head Address | H stands for head number 0 or 1 as specified in ID field. |
| HD | Head | HD stands for a selected Head number 0 or 1 and controls the polarity of pin 27. (H = HD in all command words.) |
| HLT | Head Load Time | HLT stands for the Head Load Time in the FDD (2 to 254 ms in 2 ms increments). |
| HUT | Head Unload Time | HUT stands for the Head Unload Time after a READ or WRITE operation has occurred (16 to 240 ms in 16 ms increments). |
| MF | FM or MFM Mode | If MF is low, FM Mode is selected, and if it is high, MFM Mode is selected. |
| MT | Multi-Track | If MT is high, a Multi-Track operation is to be performed. If MT=1 after finishing READ/WRITE operation on side 0, FDC will automatically start searching for sector 1 on side 1. |
| N | Number | N stands for the number of data bytes written in Sector. |
| NCN | New Cylinder Number | NCN stands for a New Cylinder Number, which is to be reached as a result of the SEEK operation. Desired position of Head. |
| ND | Non-DMA Mode | ND stands for operation in the Non-DMA Mode. |
| PCN | Present Cylinder Number | PCN stands for the Cylinder number at the completion of SENSE INTERRUPT STATUS Command. Position of Head at present time. |
| R | Record | R stands for the sector number, which will be read or written. |
| R/W | READ/WRITE | R/W stands for either READ (R) or WRITE (W) signal. |
| SC | Sector | SC indicates the number of sectors per cylinder. |
| SK | Skip | SK stands for Skip Deleted Data Address Mark. |
| SRT | Step Rate Time | SRT stands for the Stepping Rate for the FDD. (1 to 16 ms in 1 ms increments.) Stepping Rate applies to all drives. (F=1 ms, E=2 ms, etc.) |

Table 7-9. Command Symbol Description (cont' d)

| Symbol | Name | Description |
|--------------------------|--|--|
| ST0 ST1 ST2 ST3 | Status 0 Status 1 Status 2 Status 3 | ST 0-3 stands for one of four registers which stores the status information after a command has been executed. This information is available during the result phase after command execution. These registers should not be confused with the main status register (selected by $A_0 = 0$); ST 0-3 may be read only after a command has been executed and contains information relevant to that particular command. |
| STP | | If STP = 1 during a Scan operation, the data in contiguous sectors is compared byte by byte with data sent from the processor (or DMA); and if STP = 2, alternate sectors are read and compared. |
| US0, US1 | Unit Select | US stands for a selected drive number 0 or 1. |

(1) READ DATA

This mode is set by nine command bytes. Each READ operation is initialized by a READ command and finished by reading the data from FIFO through FDC. The sector address automatically increases by 1 and the data from the next sector is read and sent through the FIFO.

Such a continuous function is called a "Multi Sector READ Operation". When a TC or an implied TC is received, the FDC stops sending data, but continues to read data from the current sector. In addition, it checks the CRC bytes until the READ operation is completed to the end of the sector.

The sector size is determined by the N value, from the following formula: sector size = $2^{(7+N \text{ value})}$ bytes. If the sector size is 128 and the DTL is less than it, the remaining bytes will be READ and checked for CRC error by the FDC. If this occurs in a WRITE operation, the remaining bytes will be filled with 0. If the sector size is not 128, ($N > 00$), the DTL should be set to FFh. The MT (multi-track) allows the FDC to read both sides of the diskette.

Both N and MT determine the amount of data, as indicated in the table below:

Table 7-10. Effects of MT and N Bits

| Effects of MT and N Bits | | | |
|--------------------------|---|---------------------------|-----------------------------|
| MT | N | Maximum Transfer Capacity | Final Sector READ from Disk |
| 0 | 1 | 256 X 26 = 6656 | 26 at side 0 or 1 |
| 1 | 1 | 256 X 52 = 13312 | 26 at side 1 |
| 0 | 2 | 512 X 15 = 7680 | 15 at side 0 or 1 |
| 1 | 2 | 512 X 30 = 15360 | 15 at side 1 |
| 0 | 3 | 1024 X 8 = 8192 | 8 at side 0 or 1 |
| 1 | 3 | 1024 X 16 = 16384 | 16 at side 1 |

Table 7-11. Description of the READ DATA Command

| READ DATA | | | | | | | | | | |
|-----------|-----|----------|--------|----|-----|----|-----|-----|-----|--|
| Phase | R/W | Data Bus | | | | | | | | |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | Remarks |
| Command | W | MT | MFM SK | 0 | 0 | 0 | 1 | 1 | 0 | Command Codes |

| | W | | | | DTL | | | | | |
| Execution | | | | | | | | | | Data transfer between the FDD and the main system. |
| Result | R | | | | ST0 | | | | | Status information after command execution |
| | R | | | | ST1 | | | | | |
| | R | | | | ST2 | | | | | |
| | R | | | | C | | | | | Sector ID information after command execution. |
| | R | | | | H | | | | | |
| | R | | | | R | | | | | |
| | R | | | | N | | | | | |

(2) READ DELETED DATA

Except for operating on sectors which have a Deleted Data Address Mark at the beginning of a data field, the READ DELETED DATA command is identical to the READ DATA provided in the previous section.

Table 7-12. Description of the READ DELETED DATA Command

| READ DELETED DATA | | | | | | | | | | | |
|-------------------|-----|----------|--------|----|----|-----|-----|-----|-----|--|---|
| Phase | R/W | Data Bus | | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | | |
| Command | W | MT | MFM SK | 0 | 1 | 1 | 0 | 0 | | | Command Codes Sector ID information before the command execution |
| | W | 0 | 0 | 0 | 0 | 0 | HDS | DS1 | DS0 | | |
| | W | | | | | C | | | | | |
| | W | | | | | H | | | | | |
| | W | | | | | R | | | | | |

| | R | | | | | R | | | | | |
| | R | | | | | N | | | | | |

www.DataSheet4U.com

(3) READ A TRACK

After receiving a pulse from the INDEX# pin, this READ command reads the entire data field from each sector of the track as continuous blocks. If any ID or Data CRC error is found, it continues to read data from the track and indicates the error at the end. Because the MT operation is not allowed under this command, the MT and SK bits should be low during the command execution.

This command terminates normally when the number of sectors specified by EOT has not been read. Provided that any ID Address Mark has been found, the FDC will set the IC code in ST0 to 01 after the second occurrence of the INDEX pulse, indicating an abnormal termination, then finishes this command.

Table 7-13. Description of the READ A TRACK Command

| READ A TRACK | | | | | | | | | | |
|--------------|-----|----------|--------|----|-----|----|-----|-----|-----|---|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |

| | R | | | | ST1 | | | | | |
| | R | | | | ST2 | | | | | |
| | R | | | | C | | | | | |
| | R | | | | H | | | | | |
| | R | | | | R | | | | | |
| | R | | | | N | | | | | |
| | | | | | | | | | | Sector ID information after command execution |

(4) WRITE DATA

Each WRITE operation begins with a WRITE DATA command and terminates when data is written into the sector data field, from the host via the FIFO. After this, the FDC computes the CRC value and stores it in the CRC field. The sector number in "R" is incremented by 1, and the next data operation is performed (Multi Sector WRITE Operation). During this operation, when a terminal count signal or an over/underrun occurs, the remaining data field is filled with 0s. The operation of WRITE DATA command is similar to that of the READ DATA command in many respects, such as transfer capacity, end of the cylinder bit, no data bit, and ID information. The definition of DTL for those cases in N is the same as "no" or 0, etc.

Table 7-14. Description of the WRITE DATA Command

| WRITE DATA | | | | | | | | | | |
|------------|-----|----------|-------|----|-----|----|-----|-----|-----|---|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | MT | MFM 0 | 0 | 0 | 1 | 0 | 1 | | Command Codes |
| | W | 0 | 0 | 0 | 0 | 0 | HDS | DS1 | DS0 | |
| | W | | | | C | | | | | |
| | W | | | | H | | | | | |
| | W | | | | R | | | | | |
| | W | | | | N | | | | | |
| | W | | | | EOT | | | | | |
| | W | | | | GPL | | | | | |
| | W | | | | DTL | | | | | |
| Execution | | | | | | | | | | Data transfer between the FDD and main system |
| Result | R | | | | ST0 | | | | | Status information after command execution |
| | R | | | | ST1 | | | | | |
| | R | | | | ST2 | | | | | |

| | R | | | | H | | | | | |
| | R | | | | R | | | | | |
| | R | | | | N | | | | | |

(5) WRITE DELETED DATA

This command is the same as the WRITE DATA command, except that a Deleted Data Address Mark is written at the beginning of the data field.

Table 7-15. Description of the WRITE DELETED DATA Command

| WRITE DELETED DATA | | | | | | | | | | |
|---------------------------|------------|-----------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|---|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | MT | MFM 0 | 0 | 1 | 0 | 0 | 1 | | Command Codes |
| | W | 0 | 0 | 0 | 0 | 0 | HDS | DS1 | DS0 | |
| | W | | | | C | | | | | |
| | W | | | | H | | | | | |
| | W | | | | R | | | | | |
| | W | | | | N | | | | | |

| | R | | | | R | | | | | |
| | R | | | | N | | | | | |

(6) FORMAT A TRACK

This command is used to format an entire track. Initialized by an INDEX pulse, it writes data to the gaps, address marks, ID fields and data fields. The gaps and data field values are controlled by the host-specified values programmed into N, SC, GPL, and D. The data field is filled with the data byte specified by D. Four data bytes per sector of the ID field: C, H, R, and N are supplied by the host. The C, R, H, and N values must be renewed for each new sector of a track. Only the R value must be changed when a sector is formatted, allowing the disk to be formatted with non-sequential sector addresses. These steps will continue until a new INDEX pulse or the command terminal signal is received.

Table 7-16. Description of the FORMAT A TRACK Command

| FORMAT A TRACK | | | | | | | | | | |
|----------------|-----|----------|-------|----|-----|----|-----|-----|-----|--|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | 0 | MFM 0 | 0 | 1 | 1 | 0 | 1 | | Command Codes |
| | W | 0 | 0 | 0 | 0 | 0 | HDS | DS1 | DS0 | |
| | W | | | | N | | | | | |
| | W | | | | SC | | | | | |
| | W | | | | GPL | | | | | |
| | W | | | | D | | | | | |
| Execution | | | | | | | | | | FDC formats an entire cylinder |
| Result | R | | | | ST0 | | | | | Status information after command execution |
| | R | | | | ST1 | | | | | |
| | R | | | | ST2 | | | | | |
| | R | | | | C | | | | | |
| | R | | | | H | | | | | |
| | R | | | | R | | | | | |
| | R | | | | N | | | | | |
| | | | | | | | | | | In this case, the ID information has no meaning. |

Control Commands

A special feature of these commands is that they don't transfer any data. Only three of them generate interrupts when finished (READ ID, RE-CALIBRATE and SEEK).

(7) READ ID

This command, used to find the actual recording head position, stores at the same time as it reads the first ID field value into the FDC registers. If this doesn't occur even when the second INDEX pulse is issued, an abnormal termination will be generated by setting the IC code in the ST0 to 01.

Table 7-17. Description of the READ ID Command

| READ ID | | | | | | | | | | |
|-----------|-----|----------|-------|----|-----|----|-----|-----|-----|--|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | 0 | MFM 0 | 0 | 1 | 0 | 1 | 0 | | Command Codes |
| | W | 0 | 0 | 0 | 0 | 0 | HDS | DS1 | DS0 | |
| Execution | | | | | | | | | | The first correct ID information on the Cylinder is stored in the Data Register. |
| Result | R | | | | ST0 | | | | | Status information after command execution |
| | R | | | | ST1 | | | | | |
| | R | | | | ST2 | | | | | |
| | R | | | | C | | | | | Sector ID information during execution phase |
| | R | | | | H | | | | | |
| | R | | | | R | | | | | |
| | R | | | | N | | | | | |

(8) RE-CALIBRATE

This command retracts the READ/WRITE head to the track 0 position, resetting the value of the PCN counter and checking the TK00# status. If TK00# is low the DIR# pin remains low; if TK00# is high, SE and EC bits are set high, and the command is finished. When TK00# remains low for 77 step pulses, the command is terminated by setting SE and EC bits as described previously. Consequently, if the disk can accommodate more than 80 tracks, more than one RE-CALIBRATE command is required to retract the head to the physical track 0.

Table 7-18. Description of the RE-CALIBRATE Command

| RE-CALIBRATE | | | | | | | | | | |
|--------------|-----|----------|----|----|----|----|----|-----|-----|---------------------------|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | Command Codes |
| Execution | W | 0 | 0 | 0 | 0 | 0 | 0 | DS1 | DS0 | |
| | | | | | | | | | | Head retracted to Track 0 |

(9) SEEK

This command controls the READ/WRITE head movement from one track to another. FDC compares PCN's current head position with NCN values after each step pulse to determine the head movement direction, as the following:

PCN < NCN: sets direction signal to 1 and issues step pulses

PCN > NCN: sets direction signal to 0 and issues step pulses

The impulse rate of step pulse is controlled by Stepping Rate Time in the SPECIFY command. The SEEK command will be terminated by setting SE to 1 when the comparison result is PCN = NCN.

For the parallel SEEK operation, the FDC returns to Non-Busy State after the command phase (in Busy State), allowing another SEEK or RE-CALIBRATE command to be issued. Since the SEEK command doesn't have a result phase, it is recommended that a SENSE INTERRUPT command be issued after each SEEK command to verify the head position.

Table 7-19. Description of the SEEK Command

| SEEK | | | | | | | | | | |
|-----------|-----|----------|----|----|----|----|-----|-----|-----|--|
| PHASE | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 | Command Codes |
| | W | 0 | 0 | 0 | 0 | 0 | HDS | DS1 | DS0 | |
| | W | NCN | | | | | | | | |
| Execution | | | | | | | | | | Head is positioned over proper cylinder on diskette. |

(10) SENSE INTERRUPT STATUS

This command resets the interrupt signal, and identifies the cause of interrupt via IC code and SE bit of ST0, as shown in the table below:

Table 7-20. Interrupt Identification of the SENSE INTERRUPT STATUS Command

| Interrupt Identification | | |
|--------------------------|----|--|
| SE | IC | INTERRUPT DUE TO |
| 0 | 11 | Polling |
| 1 | 00 | Normal termination of SEEK or RE-CALIBRATE command |
| 1 | 01 | Abnormal termination of SEEK or RE-CALIBRATE command |

It may be necessary to generate an interrupt when the following conditions occur:

- Before any DATA TRANSFER or READ ID command
- After SEEK, RELATIVE SEEK, or RE-CALIBRATE command (no result phase exists)
- When a DATA TRANSFER is required during an execution phase in the non-DMA mode

Table 7-21. Description of the SENSE INTERRUPT STATUS Command

| SENSE INTERRUPT STATUS | | | | | | | | | | |
|------------------------|-----|----------|----|----|----|----|----|----|----|--|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | Command Codes |
| Result | R | ST0 | | | | | | | | Status information at the end of each SEEK operation |
| | R | PCN | | | | | | | | |

(11) SENSE DRIVE STATUS

This non-execution phase command provides the drive status information which is saved in ST3 (Status Register 3).

Table 7-22. Description of the SENSE DRIVE STATUS Command

| SENSE DRIVE STATUS | | | | | | | | | | |
|--------------------|-----|----------|----|----|----|----|-----|-----|-----|------------------------------|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 | Command Codes |
| | W | 0 | 0 | 0 | 0 | 0 | HDS | DS1 | DS0 | |
| Result | R | ST3 | | | | | | | | Status information about FDD |
| | | | | | | | | | | |

(12) SPECIFY

The initial values of the HUT (Head Unload Time), HLT (Head Load Time) and SRT (Step Rate Time) are individually set by this command, as shown in the table below:

Table 7-23. Description of the SPECIFY Command

| SPECIFY | | | | | | | | | | |
|---------|-----|----------|----|----|----|-----|----|----|----|---------------|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | Command Codes |
| | W | SRT | | | | HUT | | | | |
| | W | HLT | | | | | | | ND | |

(13) INVALID

When an undefined command is sent to FDC, the FDC will terminate the command without interrupt. Bit 6 and bit 7 in the Main Status Register are both high. When the CPU reads Status Register 0, it will find an 80H.

Table 7-24. Description of the INVALID Command

| INVALID | | | | | | | | | | |
|---------|-----|---------------|----|----|----|----|----|----|----|---|
| Phase | R/W | Data Bus | | | | | | | | Remarks |
| | | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 | |
| Command | W | invalid codes | | | | | | | | INVALID Command Codes (NOOP - FDC goes into stand by state) |
| Result | R | ST0 | | | | | | | | ST0 = 80 |

7.4 Serial Channel Register Description

IT8671F incorporates two enhanced serial channels that perform serial to parallel conversion on received data, and parallel to serial conversion on transmitted data. Each of the serial channels individually contains a programmable baud rate generator that is capable of dividing the input clock by a number from 1 to 65535; the data rate of each can also be programmed from 115.2K baud down to 50 baud. The character options are programmable for 1 start bit; 1, 1.5 or 2 stop bits; even, odd, stick or no parity; and privileged interrupts.

Table 7-25. Serial Channel Registers

| Register | DLAB* | Address | READ | WRITE |
|----------|-------|-----------|---|-----------------------------------|
| Data | 0 | Base + 0h | RBR (Receiver Buffer Register) | TBR (Transmitter Buffer Register) |
| Control | 0 | Base + 1h | IER (Interrupt Enable Register) | IER |
| | x | Base + 2h | IIR (Interrupt Identification Register) | FCR (FIFO Control Register) |
| | x | Base + 3h | LCR (Line Control Register) | LCR |
| | x | Base + 4h | MCR (Modem Control Register) | MCR |
| | 1 | Base + 0h | DLL (Divisor Latch LSB) | DLL |
| | 1 | Base + 1h | DLM (Divisor Latch MSB) | DLM |
| Status | x | Base + 5h | LSR (Line Status Register) | LSR |
| | x | Base + 6h | MSR (Modem Status Register) | MSR |
| | x | Base + 7h | SCR (Scratch Pad Register) | SCR |

* DLAB is bit 7 of the Line Control Register.

7.4.1 Data Register

TBR and RBR each hold from five to eight data bits. If the transmitted data is less than eight bits, it aligns to the LSB. Either received or transmitted data is buffered by a shift register, and is latched first by a holding register. The bit 0 of any word is first received and transmitted.

(1) RBR (Read only)

This register receives and holds the incoming data. It contains a non-accessible shift register which converts the incoming serial data stream into a parallel 8-bit word.

(2) TBR (Write only)

This register holds and transmits the data via a non-accessible shift register, and converts the outgoing parallel data into a serial stream before transmission.

7.4.2 Control Registers: IER, IIR, FCR, DLL, DLM, LCR and MCR

(1) IER (READ/WRITE)

The IER is used to enable (or disable) four active high interrupts which activate the interrupt outputs, with its lower four bits: IER(0), IER(1), IER(2), and IER(3).

IER(0): Sets this bit high to enable the Received Data Available Interrupt (and Time-out Interrupt in the FIFO mode).

IER(1): Sets this bit high to enable the Transmitter Holding Register Empty Interrupt.

IER(2): Sets this bit high to enable the Receiver Line Status Interrupt which is caused when Overrun, Parity, Framing or Break occurs.

IER(3): Sets this bit high to enable the Modem Status Interrupt when one of the Modem Status Registers changes its bit state.

www.DataSheet4U.com

IIR(4)~IIR(7): These bits are always "0."

(2) IIR (Read only)

This register facilitates the host CPU to determine interrupt priority and its source. The priority of four existing interrupt levels is listed below:

1. Received Line Status (highest priority)
2. Received Data Ready

3. Transmitter Holding Register Empty
4. Modem Status (lowest priority)

When a privileged interrupt is pending and the type of interrupt is stored in the IIR which is accessed by the Host, the serial channel holds back all interrupts and indicates the pending interrupts with the highest priority to the Host. Any new interrupts will not be acknowledged until the Host access is over. The contents of the IIR are described in the table below:

Table 7-26. Interrupt Identification Register

| FIFO Mode | Interrupt Identification Register | | | Interrupt Set and Reset Functions | | | |
|-----------|-----------------------------------|-------|-------|-----------------------------------|----------------|------------------------------------|------------------------------------|
| | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Priority Level | Interrupt Type | Interrupt Source |
| | 0 | X | X | 1 | - | None | None |
| | 0 | 1 | 1 | 0 | First | Receiver Line Status | OE, PE, FE, or BI |
| | 0 | 1 | 0 | 0 | Second | Received Data Available | Received Data Available |
| | 1 | 1 | 0 | 0 | Second | Character Timeout Indication | RBR READ |
| | 0 | 0 | 1 | 0 | Third | Transmitter Holding Register Empty | Transmitter Holding Register Empty |
| | 0 | 0 | 0 | 0 | Fourth | Modem Status | CTS#, DSR#, RI#, RSLD# |

Note: X = Not Defined

IIR(0) : Is used to indicate a pending interrupt in either a hard-wired prioritized or polled environment, with a logic 0 state. In such a case, IIR contents may be used as a pointer to the appropriate interrupt service routine.

IIR(1), IIR(2) : Are used to identify the highest priority interrupt pending.

IIR(3) : In non-FIFO mode, this bit is a logic 0. In the FIFO mode this bit is set along with bit 2 when a Time-out Interrupt is pending.

IIR(4), IIR(5) : Always logic 0.

IIR(6), IIR(7) : Are set when FCR(0) = 1.

(3) FCR

FCR: (WRITE only) This register is used to enable, clear the FIFO, and set the RCVR FIFO trigger level.

FCR(0): XMIT and RCVR FIFO are enabled when this bit is set high. XMIT and RCVR FIFO's is disabled and cleared when this bit is cleared to low. This bit must be a logic 1 if the other bits of the FCR are written to or they will not be properly programmed. When this register changes to non-FIFO mode, all its contents are cleared.

www.DataSheet4U.com

FCR(1): Setting this self-clearing bit to logic 1 clears all contents of the RCVR FIFO and resets its related counter to 0 (except the shift register).

FCR(2): This self-clearing bit clears all contents of the XMIT FIFO and resets its related counter to 0 via a logic "1."

FCR(3): This bit doesn't affect the Serial Channel operation. RXRDY and TXRDY functions are not available on this chip.

FCR(4), FCR(5) : Reserved.

FCR(6), FCR(7) : These bits set the trigger levels for the RCVR FIFO interrupt.

| FCR (7) | FCR (6) | RCVR FIFO Trigger Level |
|---------|---------|-------------------------|
| 0 | 0 | 1 byte |
| 0 | 1 | 4 bytes |
| 1 | 0 | 8 bytes |
| 1 | 1 | 14 bytes |

(4) Divisor Latches

Two 8-bit Divisor Latches (DLL and DLM) store the divisor in a 16-bit binary format. They are loaded during the initialization to generate a desired Baud Rate.

Baud Rate Generator (BRG)

Each serial channel contains a programmable BRG which can take any clock input (from DC to 8 MHz) to generate standard ANSI/CCITT bit rates for the channel clocking with an external clock oscillator. The DLL or DLM is a number of 16-bit format, providing the divisor range from 1 to 2^{16} to obtain the desired baud rate. The output frequency is 16X data rate.

(5) Scratch Pad Register (READ/WRITE)

This 8-bit register does not control the operation of UART in any way. It is intended as a scratch pad register to be used by a programmer to temporarily hold general purpose data.

Table 7-27. Baud Rates Using (24MHz , 13) Clock

| Desired Baud Rate | Divisor Used |
|-------------------|--------------|
| 50 | 2304 |
| 75 | 1536 |
| 110 | 1047 |
| 134.5 | 857 |
| 150 | 768 |
| 300 | 384 |
| 600 | 192 |
| 1200 | 96 |
| 1800 | 64 |
| 2000 | 58 |
| 2400 | 48 |
| 3600 | 32 |
| 4800 | 24 |
| 7200 | 16 |
| 9600 | 12 |
| 19200 | 6 |
| 38400 | 3 |
| 57600 | 2 |
| 115200 | 1 |

(6) LCR (READ/WRITE)

LCR controls the format of the data character and supplies the information of the serial line. Its contents are:

LCR(0): Word Length Select bit 0 (WLS 0)

LCR(1): Word Length Select bit 1 (WLS 1)

LCR(2): Stop bit Select (STB)

LCR(3): Parity Enable (PEN)

LCR(4): Even Parity Select (EPS)

LCR(5): Stick Parity bit

LCR(6): Break Control

LCR(7): Divisor Latch Access bit

LCR(0) and LCR(1): Specify the number of bits in each serial character, encoded as below:

| LCR (1) | LCR (0) | Word Length |
|---------|---------|-------------|
| 0 | 0 | 5 bits |
| 0 | 1 | 6 bits |
| 1 | 0 | 7 bits |
| 1 | 1 | 8 bits |

LCR(2) specifies the number of stop bits in each serial character, as summarized below:

| LCR (2) | Word Length | No. of Stop Bits |
|---------|-------------|------------------|
| 0 | - | 1 |
| 1 | 5 bits | 1.5 |
| 1 | 6 bits | 2 |
| 1 | 7 bits | 2 |
| 1 | 8 bits | 2 |

Note: The receiver will ignore all stop bits beyond the first, regardless of the number used in transmission.

LCR(3): A parity bit, between the last data word bit and stop bit, will be generated or checked (transmit or receive data) when LCR(3) is high.

LCR(4): When parity is enabled (LCR(3) = 1), LCR(4) = 0 selects odd parity, and LCR(4) = 1 selects even parity.

LCR(5): When this bit and LCR(3) are high at the same time, the parity bit is transmitted, and then detected by receiver, in opposite state by LCR(4) to force the parity into a known state and to check the parity bit in a known state.

LCR(6): Forces the Serial Output (SOUT) to the spacing state (logic 0) by a logic 1, and this state will remain until a low level resetting LCR(6), enabling the serial port to alert the terminal in a communication system.

LCR(7): Must be set to high to access the Divisor Latches of the baud rate generator during READ or WRITE operations. It must be set low to access the Data Register (RBR and TBR) or the Interrupt Enable Register.

(7) MCR (READ/WRITE)

Controls the interface by the modem or data set (or device emulating a modem).

Table 7-28. Modem Control Register Bits

| MCR Bits | Logic 1 | Logic 0 |
|-----------------------------------|-----------------|------------------|
| MCR(7) 0 | | |
| MCR(6) 0 | | |
| MCR(5) 0 | | |
| MCR(4) Loop | Loop Enabled | Loop Disabled |
| MCR(3) Interrupt (INT) Enable | INT Enabled | INT Disabled |
| MCR(2) 0 | | |
| MCR(1) Request to Send (RTS#) | RTS# Output Low | RTS# Output High |
| MCR(0) Data Terminal ready (DTR#) | DTR# Output Low | DTR# Output High |

MCR(7)~MCR(5): Are always low.

MCR(4): Provides a loopback feature for diagnostic test of the serial channel when it is set high. Serial Output (SOUT) is set to the Marking State Shift Register output loops back into the Receiver Shift Register, all Modem Control inputs (CTS#, DSR#, RI# and RLSD#) are disconnected. The four Modem Control outputs (DTR#, RTS#, OUT1 and OUT2) are internally connected to the four Modem Control inputs and forced to inactive high and the transmitted data is immediately received, allowing the processor to verify the transmit and receive data path of the serial channel.

MCR(3): Is the Output 2 bit and enables the serial port interrupt output by a logic 1.

MCR(2): Controls the Output 1 bit, which does not have an output pin and can only be read or written by the CPU.

MCR(1): Controls the Request to Send (RTS#) which is in an inverse logic state with that of MCR(1).

MCR(0): Controls the Data Terminal ready (DTR#) which is in an inverse logic state with that of the MCR(0).

7.4.3 Status Register LSR and MSR

(1) LSR (READ/WRITE)

This register provides status indications and is usually the first register read by the CPU to determine the cause of an interrupt or to poll the status of each serial channel. The contents of the LSR are described below:

LSR(7): In 450 mode, this bit is always 0. In the FIFO mode, it sets high when there is at least one (1) parity error, framing or break interrupt in the FIFO. This bit is cleared when the CPU reads LSR, if there are no subsequent errors in the FIFO.

LSR(6): Read-only bit indicates that the Transmitter Holding Register and Transmitter Shift Register are both empty. Otherwise, this bit is "0," and has the same function in the FIFO mode.

LSR(5): Transmitter Holding Register Empty (THRE). This read-only bit indicates that the TBR is empty and is ready to accept a new character for transmission. It is set high when a character is transferred from the THR into the Transmitter Shift Register, causing a priority 3 IIR interrupt which is cleared by a READ of IIR. In the FIFO mode, it is set when the XMIT FIFO is empty and it is cleared when at least one byte is written to the XMIT FIFO.

www.DataSheet4U.com

LSR(4): Break Interrupt (BI) status bit indicates that the last character received was a break character, (invalid but entire character), including parity and stop bits. This occurs when the received data input is held in the spacing (logic 0) for longer than a full word transmission time (start bit + data bits + parity + stop bit). When any of these error conditions is detected (LSR(1) to LSR(4)), a Receiver Line Status interrupt (priority 1) will be produced in the IIR, with the IER(2) previously enabled.

LSR(3): Framing Error (FE) bit, a logic 1, indicates that the stop bit in the received character was not valid. It resets low when CPU reads the contents of LSR.

LSR(2): Indicates the parity error (PE) with a logic 1, indicating that the received data character does

not have the correct even or odd parity, as selected by LCR(4). It will be reset to "0" whenever the LSR is read by the CPU.

LSR(1): Overrun Error (OE) bit indicates by a logic 1 that the RBR has been overwritten by the next character before it had been read by the CPU. In the FIFO mode, the OE occurs when the FIFO is full and the next character has been completely received by the Shift Register. It will be reset when the LSR is read by the CPU.

LSR(0): Data ready (DR) bit logic "1" indicates a character has been received by RBR. And logic "0" indicates all of the data in RBR or RCV FIFO has been read.

Table 7-29. Line Status Register Bits

| LSR Bits | Logic 1 | Logic 0 |
|---|---------|-----------|
| LSR(7) PE/FE/BI (FIFO mode) | Error | No error |
| LSR(6) Transmitter Empty(TEMT) | Empty | Not empty |
| LSR(5) Transmitter Holding Register Empty(THRE) | Empty | Not empty |
| LSR(4) Break Interrupt(BI) | Break | No break |
| LSR(3) Framing Error(FE) | Error | No error |
| LSR(2) Parity Error(PE) | Error | No error |
| LSR(1) Overrun Error(OE) | Error | No error |
| LSR(0) Data Ready(DR) | Ready | Not ready |

(2) MSR (READ/WRITE)

This 8-bit register provides current state of the control lines with modems or peripheral devices in addition to this current state information; four of these eight bits MSR(4) - MSR(7) can provide change information when a modem control input changes state. It is reset low when the Host reads the MSR.

MSR(7): Receive Line Signal Detect - Indicates the complement status of Receive Line Signal Detect (RLSD#) input. If MCR(4) = 1, MSR(7) is equivalent to OUT2 of the MCR.

MSR(6): Ring Indicator (RI#) - Indicates the complement status to the RI# input. If MCR(4)=1, MSR(6) is equivalent to OUT1 in the MCR.

MSR(5): Data Set Ready (DSR#) - Indicates that the modem is ready to provide received data to the serial channel receiver circuitry. If the serial channel is in the loop mode (MCR(5) = 1), MSR(5) is equivalent to DTR# in the MCR.

MSR(4): Clear to Send (CTS#) - Indicates the complement of CTS# input. When the serial channel is in the loop mode (MCR(4)=1), MSR(5) is equivalent to RTS# in the MCR.

MSR(3): Delta Receiver Line Signal Detect (DRLSD) - Indicates that the RLSD# input state has been changed since the last time read by the Host.

MSR(2): Trailing Edge of Ring Indicator (TERI) - Indicates that the RI input state to the serial channel has been changed from a low to high

www.DataSheet4U.com

since the last time read by the Host. The change to logic 1 doesn't activate the TERI.

MSR(1) : Delta Data Set Ready (DDSR) - A logic "1" indicates that the DSR# input state to the serial channel has been changed since the last time read by the Host.

MSR(0): Delta Clear to Send (DCTS) - Indicates that the CTS# input state to the serial channel has been changed since the last time read by the Host.

Table 7-30. Modem Status Register Bits

| MSR Bits | Mnemonic | Description |
|----------|----------|-----------------------------------|
| MSR(7) | RLSD# | Receiver Line Signal Detect |
| MSR(6) | RI# | Ring Indicator |
| MSR(5) | DSKR# | Data Set Ready |
| MSR(4) | CTS# | Clear To Send |
| MSR(3) | DRLSD# | Delta Receiver Line Signal Detect |
| MSR(2) | TERI | Trailing Edge of Ring Indicator |
| MSR(1) | DDSR | Delta Data Set Ready |
| MSR(0) | DCTS | Delta Clear to Send |

7.4.4 Reset

Reset of IT8671F should be held to an idle mode reset high for 500ns until initialization, and this causes the following:

1. Initialization of the transmitter and receiver internal clock counters.

2. Resetting all bits of LSR, (except LSR(5) and LSR(6), THRE and TEMT (they are set only by a hardware reset), all bits of MCR and all corresponding discrete lines, memory and logic elements. Before resetting, IT8671F remains in the idle modes until programmed.

Table 7-31. Reset Control of Register and Pinout Signals

| Register/Signal | Reset Control | Reset Status |
|-----------------------------------|---------------|---------------------------------------|
| Interrupt Enable Register | Reset | All bits Low |
| Interrupt Identification Register | Reset | Bit 0 is high and bits 1-7 are low. |
| FIFO Control Register | Reset | All bits Low |
| Line Control Register | Reset | All bits Low |
| Modem Control Register | Reset | All bits Low |
| Line Status Register | Reset | Bits 5 and 6 are high, others are low |
| Modem Status Register | Reset | Bits 0-3 low, bits 4-7 input signals |
| SOUT0, SOUT1 | Reset | High |
| RTS0#, RTS1#, DTR0#, DTR1# | Reset | High |
| IRQ of Serial Port | Reset | High Impedance |

7.4.5 Programming

Each serial channel of IT8671F is programmed by control registers, whose contents define the character length, number of stop bits, parity, baud rate and modem interface. Even though the control register can be written in any given order, the IER should be the last because it controls the interrupt enables. After the port is programmed, these

registers can still be updated whenever the port is not transferring data.

7.4.6 Software Reset

This approach allows returning to a completely known state without a system reset. This is achieved by writing the required data to the LCR, DLL, DLM and MCR. The LSR and RBR

www.DataSheet4U.com

must be read before enabling interrupts to clear out any residual data or status bits which may be invalid for subsequent operations.

7.4.7 Clock Input Operation

The input frequency of the Serial Channel is $24\text{MHz} \div 13$, not exactly 1.8432MHz .

7.4.8 FIFO Interrupt Mode Operation

(1) RCVR Interrupt

When set $\text{FCR}(0)=1$ and $\text{IER}(0)=1$, the RCVR FIFO and receiver interrupts are enabled. The RCVR interrupt occurs under the following conditions:

- The receive data available interrupt and the IIR, receive data available indication, will be issued only if the FIFO has reached its programmed trigger level. They will be cleared as soon as the FIFO drops below its trigger level.
- The receiver line status interrupt has higher priority than the received data available interrupt.
- The time-out timer will be reset after receiving a new character or after the Host reads the RCVR FIFO whenever a time-out interrupt occurs. The timer will be reset when the Host reads one character from the RCVR FIFO.

RCVR FIFO time-out Interrupt: By enabling RCVR FIFO and receiver interrupts, the RCVR FIFO time-out interrupt will occur under the following conditions:

- It will occur only if there is at least one character in the FIFO whenever the interval between the most recent received serial character and the most recent Host READ from the FIFO is longer than four consecutive character times.
- The RLCK clock signal input is used to calculate character times.
- The time-out timer will be reset after receiving a new character or after the Host reads the

RCVR FIFO whenever any time-out interrupt occurs. The timer will be reset when the Host reads one character from the RCVR FIFO.

(2) XMIT Interrupt

By setting $\text{FCR}(0)$ and $\text{IER}(1)$ to high, the XMIT FIFO and transmitter interrupts are enabled, and the XMIT interrupt will occur under the conditions described below:

- The transmitter interrupt will occur when the XMIT FIFO is empty, and it will be reset if the THR is written or the IIR is read.
- The transmitter FIFO empty indications will be delayed one character time minus the last stop bit time whenever the following condition occurs: $\text{THRE} = 1$ and there have not been at least two bytes in the transmitter FIFO at the same time since the last $\text{THRE} = 1$. The transmitter interrupt after changing $\text{FCR}(0)$ will be immediate. Once it is enabled, the THRE indication is delayed one character time minus the last stop bit time.

The character time-out and RCVR FIFO trigger level interrupts are in the same priority order as the received data available interrupt. The XMIT FIFO empty is in the same priority as the transmitter holding register empty interrupt.

FIFO Polled Mode Operation [$\text{FCR}(0)=1$, and $\text{IER}(0)$, $\text{IER}(1)$, $\text{IER}(2)$, $\text{IER}(3)$ or all are zero]

Either or both XMIT and RCVR can be in this operation mode which the user program will check RCVR and XMIT status via the LSR as described below:

LSR(7): RCVR FIFO error indication

LSR(6): XMIT FIFO and Shift register empty

LSR(5): The XMIT FIFO empty indication
LSR(1) - LSR(4) : Specifies that errors have occurred. Character error status is handled the same way as that in the interrupt mode. The IIR is not affected since $\text{IER}(2)=0$.

LSR(0): Will be high whenever the RCVR FIFO contains at least one byte.

www.DataSheet4U.com

No trigger level is reached or time-out condition indicated in the FIFO Polled Mode.

7.5 Parallel Port

IT8671F incorporates one multi-mode high-performance parallel port.

IT8671F and IT8671RF support the IBM AT, PS/2 compatible bi-directional parallel port (SPP), the Enhanced Parallel Port (EPP) and the Extended Capabilities Port (ECP). Refer to the IT8671F Configuration registers and Hardware Configuration Description for information on the following: enabling/disabling, changing the base address of the parallel port, and operation mode selection.

Table 7-32. Parallel Port Connector in Different Modes

| Host Connector | Pin No. | SPP | EPP | ECP |
|----------------|---------|---------|----------|--------------------------|
| 1 | 96 | STB# | WRITE# | nStrobe |
| 2-9 | 91-84 | PD0 - 7 | PD0 - 7 | PD0 - 7 |
| 10 | 82 | ACK# | INTR | nAck |
| 11 | 81 | BUSY | WAIT# | Busy PeriphAck(2) |
| 12 | 80 | PE | (NU) (1) | PErr nAckReverse(2) |
| 13 | 79 | SLCT | (NU) (1) | Select |
| 14 | 95 | AFD# | DSTB# | nAutoFd HostAck(2) |
| 15 | 94 | ERR# | (NU) (1) | nFault nPeriphRequest(2) |
| 16 | 93 | INIT# | (NU) (1) | nInit nReverseRequest(2) |
| 17 | 92 | SLIN# | ASTB# | nSelectIn |

1. NU: Not used
 2. Fast mode
 3. For more information, please refer to the IEEE 1284 standard.

7.5.1 SPP and EPP Modes

Table 7-33. Address Map and Bit Map for SPP and EPP Modes

| Register | Address | I/O | D0 | D1 | D2 | D3 | D4 | D5 | D6 | D7 | Mode |
|------------------|---------|-----|-------|-----|------|------|------|-------|------|-------|---------|
| Data Port | Base+0H | R/W | PD0 | PD1 | PD2 | PD3 | PD4 | PD5 | PD6 | PD7 | SPP/EPP |
| Status Port | Base+1H | R | TMOUT | 1 | 1 | ERR# | SLCT | PE | ACK# | BUSY# | SPP/EPP |
| Control Port | Base+2H | R/W | STB | AFD | INIT | SLIN | IRQE | PDDIR | 1 | 1 | SPP/EPP |
| EPP Address Port | Base+3H | R/W | PD0 | PD1 | PD2 | PD3 | PD4 | PD5 | PD6 | PD7 | EPP |
| EPP Data Port0 | Base+5H | R/W | PD0 | PD1 | PD2 | PD3 | PD4 | PD5 | PD6 | PD7 | EPP |
| EPP Data Port1 | Base+5H | R/W | PD0 | PD1 | PD2 | PD3 | PD4 | PD5 | PD6 | PD7 | EPP |
| EPP Data Port2 | Base+6H | R/W | PD0 | PD1 | PD2 | PD3 | PD4 | PD5 | PD6 | PD7 | EPP |
| EPP Data Port3 | Base+7H | R/W | PD0 | PD1 | PD2 | PD3 | PD4 | PD5 | PD6 | PD7 | EPP |

Note 1. The Base Address depends on the Logical Device configuration registers of Parallel Port (0X60, 0X61).

(1) Data Port (Primary Base Address + 00h)

This is a bi-directional 8-bit data port. The direction of data flow is determined by bit 5 of the logic state of the control port register. It forwards directions when the bit is low and reverses when the bit is high.

(2) Status Port (Primary Base Address + 01h)

This is a read only register. Writing to this register has no effects. The contents of this register are latched during an IOR cycle.

Bit 7 - BUSY#: Inverse of printer BUSY signal, a logic "zero" means that the printer is busy and cannot accept another character. A logic "1" means that it is ready to accept the next character.

Bit 6 - ACK#: Printer acknowledge, a logic "0" means that the printer has received a character and is ready to accept another. A logic "1" means that it is still processing the last character.

Bit 5 - PE: Paper end, a logic "1" indicates a paper end.

Bit 4 - SLCT: Printer selected, a logic "1" means that the printer is on line.

Bit 3 - ERR#: Printer error signal, a logic "0" means an error has been detected.

Bits 1, 2: Reserved, these bits are always "one" when read.

Bit 0 - TMOUT: This bit is valid only in EPP mode and indicates that a 10-msec time out has occurred in EPP operation. A logic "0" means no time out and a logic one means that a time out error has been detected. This bit is cleared by a RESET or writing a logic "1" to it. When IT8671F is selected to non-EPP mode (SPP or ECP), this bit is always logic "one" when read.

(3) Control Port (Primary Base Address +02h)

This port provides all output signals to control the printer. The register can be read and written.

Bits 7, 6: Reserved, these two bits are always "one" when read.

Bit 5 PDDIR: Data port direction control, this bit determines the direction of the data port. Set this bit "zero" to output the data port to PD bus and "1" to input from PD bus.

Bit 4 IRQE: Interrupt request enable, setting this bit "1" enables interrupt requests from the parallel port to the Host. An interrupt request is generated by a "zero" to "one" transition of the ACK# signal.

Bit 3 SLIN: Inverse of SLIN# pin, setting this bit to "one" selects the printer.

www.DataSheet4U.com

Bit 2 INIT: Initiate printer, setting this bit to "zero" initializes the printer.

Bit 1 AFD: Inverse of the AFD# pin, setting this bit to "one" causes the printer to automatically feed after each line is printed.

Bit 0 STB: Inverse of the STB# pin, this pin controls the data strobe signal to printer.

(4) EPP Address Port (Primary Base Address + 03h)

The EPP Address Port is only available in EPP mode. When the Host writes to this port, the contents of D0 - D7 are buffered and output to PD0 - PD7. The leading edge of IOW causes an EPP ADDRESS WRITE cycle. When the Host reads from this port, the contents of PD0 - PD7 are read. The leading edge of IOR causes an EPP ADDRESS READ cycle.

(5) EPP Data Port 0-3 (Primary Base Address + 04h - 07h)

The EPP Data Ports are only available in EPP mode. When the Host writes to these ports, the contents of D0 - D7 are buffered and output to PD0 - PD7. The leading edge of IOW causes an EPP DATA WRITE cycle. When the Host reads from these ports, the contents of PD0 - PD7 are read. The leading edge of IOR causes an EPP DATA READ cycle.

7.5.2 EPP Operation

When the parallel port of IT8671F is selected to be in EPP mode, the SPP mode is also available.

Address/Data Port address is decoded (Base address + 03h- 07h), the PD bus is in the SPP mode, and the output signals such as STB#, AFD#, INIT#, and SLIN# are set by SPP control port. The direction of the data port is controlled by bit 5 of the control port register. A 10-msec time is required to prevent the system from lockup. The time has elapsed from the beginning of the IOCHRDY high (EPP READ/WRITE cycle) to WAIT# being deasserted. If a time-out occurs, the current EPP READ/WRITE cycle is aborted and a logic "1" will be read in the status port register

bit 0. The Host must write 0 to bits 0, 1, 3 of the control port register before any EPP READ/WRITE cycle (EPP spec.) The pins STB#, AFD# and SLIN# are controlled by hardware for the hardware handshaking during EPP READ/WRITE cycle.

(1) EPP ADDRESS WRITE

1. The Host writes a byte to the EPP Address Port (Base address + 03h). The chip drives D0 - D7 onto PD0 - PD7.
2. The chip drives IOCHRDY low and asserts WRITE# (STB#) and ASTB# (SLIN#) after IOW is active.
3. Peripheral deasserts WAIT, indicating that the chip may begin the termination of this cycle. The chip then deasserts ASTB#, latches the address from D0 - D7 to PD bus and releases IOCHRDY, allowing the Host to complete the I/O WRITE cycle.
4. Peripheral asserts WAIT#, indicating that it acknowledges the termination of the cycle. The chip then deasserts WRITE to terminate the cycle.

(2) EPP ADDRESS READ

1. The Host reads a byte from the EPP Address Port. The chip drives the PD bus to tristate for the peripheral to drive.
2. The chip drives IOCHRDY low and asserts ASTB# after IOR is active.
3. Peripheral drives PD bus valid and deasserts WAIT, indicating that the chip may begin to terminate this cycle. The chip then deasserts ASTB#, latches the address from PD bus to D0 -D7 and releases IOCHRDY, allowing the Host to complete the I/O READ cycle.
4. Peripheral drives PD bus to tristate and then asserts WAIT#, indicating that it acknowledges the termination of the cycle.

www.DataSheet4U.com

(3) EPP DATA WRITE

1. The host writes a byte to the EPP Data Port (Base address +04H - 07H). The chip drives D0- D7 onto PD0 -PD7.
2. The chip drives IOCHRDY low and asserts WRITE# (STB#) and DSTB (AFD#) after IOW becomes active.
3. Peripheral deasserts WAIT#, indicating that the chip may begin the termination of this cycle. The chip then deasserts DSTB#, latches the data from D0 - D7 to PD bus and releases IOCHRDY, allowing the Host to complete the I/O WRITE cycle.
4. Peripheral asserts WAIT#, indicating that it acknowledges the termination of the cycle. The chip then deasserts WRITE to terminate the cycle.

(4) EPP DATA READ

1. The Host reads a byte from the EPP DATA Port. The chip drives PD bus to tristate for peripheral to drive.
2. The chip drives IOCHRDY low and asserts DSTB# after IOR is active.
3. Peripheral drives PD bus valid and deasserts WAIT#, indicating that the chip may begin the termination of this cycle.

The chip then deasserts DSTB#, latches the data from PD bus to D0 - D7 and releases IOCHRDY allowing the host to complete the I/O READ cycle.

4. Peripheral tristates PD bus and then asserts WAIT#, indicating that it acknowledges the termination of the cycle.

7.5.3 ECP Mode

This mode is both software and hardware compatible with that of the existing parallel ports, allowing ECP to be used as a standard LPT port when ECP is not required. It provides an automatic high-burst-bandwidth channel that supports DMA or ECP in both forward or reverse directions. A 16-byte FIFO is implemented in both forward and reverse directions to smooth data flow and improve the maximum bandwidth requirement. The port supports an automatic handshaking for the standard parallel port to improve compatibility and increase the speed of mode transfer. It also supports run-length encoded (RLE) decompression in hardware. Compression is accomplished by counting identical bytes and transmitting an RLE byte that indicates how many times a byte is repeated. IT8671F and does not support hardware compression. Please refer to "Extended Capabilities Port Protocol and ISA Interface Standard" for a detailed description.

Table 7-34. Bit Map of the ECP Registers

| Register | D7 | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|----------|-------------------------|----------------------|--------|------------|----------|-------------|--------|--------|
| data | PD7 | PD6 | PD5 | PD4 | PD3 | PD2 | PD1 | PD0 |
| ecpAFifo | Addr/RLE | Address or RLE field | | | | | | |
| dsr | nBusy | nAck | PError | Select | nFault | 1 | 1 | 1 |
| dcr | 1 | 1 | PDDIR | IRQE | SelectIn | nInit | AutoFd | Strobe |
| cFifo | Parallel Port Data FIFO | | | | | | | |
| ecpDFifo | ECP Data FIFO | | | | | | | |
| tFifo | Test FIFO | | | | | | | |
| cnfgA | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| cnfgB | 0 | intrValue | 0 | 0 | 0 | 0 | 0 | 0 |
| ecr | mode | | | nErrIntrEn | dmaEn | ServiceIntr | full | empty |

(1) ECP Register Definitions

Table 7-35. ECP Register Definitions

| Name | Address | I/O | ECP Mode | Function |
|----------|--------------------|-----|----------|---------------------------|
| data | Primary Base +0H | R/W | 000-001 | Data Register |
| ecpAFIFO | Primary Base +0H | R/W | 011 | ECP FIFO (Address) |
| dsr | Primary Base +1H | R/W | All | Status Register |
| dcr | Primary Base +2H | R/W | All | Control Register |
| cFifo | Secondary Base +0H | R/W | 010 | Parallel Port Data FIFO |
| ecpDFIFO | Secondary Base +0H | R/W | 011 | ECP FIFO (DATA) |
| tFifo | Secondary Base +0H | R/W | 110 | Test FIFO |
| cnfgA | Secondary Base +0H | R | 111 | Configuration Register A |
| cnfgB | Secondary Base +1H | R/W | 111 | Configuration Register B |
| ecr | Secondary Base +2H | R/W | All | Extended Control Register |

Note 1: The Primary base address is selected by configuration registers (0X60, 0X61). The Secondary base address is selected by configuration registers (0X62, 0X63).

(2) ECP Mode Descriptions

Table 7-36. ECP Mode Descriptions

| Mode | Description |
|------|-----------------------------|
| 000 | Standard Parallel Port Mode |
| 001 | PS/2 Parallel Port Mode |
| 010 | Parallel Port FIFO Mode |
| 011 | ECP Parallel Port Mode |
| 110 | Test Mode |
| 111 | Configuration Mode |

Note: Please refer to the ECP Register Description from page 66 to 67 for detailed descriptions of mode selection.

(3) ECP Pin Descriptions

Table 7-37. ECP Pin Descriptions

| Pin | Name | Type | Description |
|-------|----------------------------|------|---|
| 96 | nStrobe (HostClk) | O | Used for handshaking with Busy to write data and addresses into the peripheral device. |
| 91-94 | PD0~PD7 | I/O | Address or data or RLE data |
| 82 | nACK (PeriphClk) | I | Used for handshaking with nAutoFd to transfer data from the peripheral device to the Host. |
| 81 | Busy (PeriphACK) | I | The peripheral uses this signal for flow control in the forward direction (hand shaking with nStrobe). In the reverse direction, this signal is used to determine whether command or data information is present on PD0~PD7. |
| 80 | PErr (nAckReverse) | I | Used to acknowledge nInit from the peripheral which drives this signal low, permitting the host to drive the PD bus. |
| 79 | Select | I | Printer On-Line indication |
| 95 | nAutoFd (HostAck) | O | In the reverse direction, it is used for handshaking between the nACK and the Host. When it is asserted, a peripheral data byte is requested. In the forward direction, this signal is used to determine whether command or data information is present on PD0 ~ PD7. |
| 94 | nFault (nPeriphRequest) | I | In the forward direction (only), the peripheral is permitted (but not required) to assert this signal (low) to request a reverse transfer while in ECP mode. The signal provides a mechanism for peer-to-peer communication. It is typically used to generate an interrupt to THE host, which has ultimate control over the transfer direction. |
| 93 | nInit (nReverseRequest) | O | The host may drive this signal low to place PD bus in the reverse direction. In ECP mode, the peripheral is permitted to drive the PD bus when nInit is low and nSelect is high. |
| 92 | nSelectIn (1284 Active) | O | Always inactive (high) in ECP mode |

(4) Data Port (Primary Base+0h, Modes 000 and 001)

Its contents will be cleared by a RESET. In a WRITE operation, the contents of the data bus are latched by Data Register at the rising edge of the IOW# input. The contents are then sent without being inverted to PD0~PD7. The contents of data ports are read and sent to the host in a READ operation.

(5) ecpAFifo PORT (Address/RLE) (Primary Base+0h, Mode 011)

Any data byte written to this port is placed in the FIFO and tagged as an ECP Address/RLE.

The hardware then sends this data automatically to the peripheral. The operation of this port is only valid in forward direction (dcr(5)=0).

(6) Device Status Register (dsr) (Primary Base+1h, Mode All)

Bits 0, 1 and 2 of this register are not implemented. They remain at high in a READ operation of Printer Status Register.

dsr(7): This bit is the inverted level of the Busy input.

dsr(6): This bit is the state of the nAck input.

dsr(5): This bit is the state of the PError input.

www.DataSheet4U.com

dsr(4): This bit is the state of the Select input.
dsr(3): This bit is the state of the nFault input.
dsr(2)~dsr(0): These bits are always 1.

(7) Device Control Register (dcr) (Primary Base+2h, Mode All)

Bits 6 and 7 of this register supply no function. They are set high during the READ operation, and cannot be written. Contents in bits 0 to 5 are initialized to 0 when the RESET pin is active.

dcr(7)~dcr(6) : These two bits are always high.
dcr(5) : Except in modes 000 and 010, setting this bit low means that the PD bus is in output operation; setting it high, in input operation. This bit will be forced low in mode 000.

dcr(4): Setting this bit high enables interrupt request from peripheral to host due to a rising edge of the nAck input.

dcr(3): It is inverted and output to the pin nSelectIn.

dcr(2): It is output to the pin nInIt without inversion.

dcr(1): It is inverted and output to the pin nAutoFd.

dcr(0): It is inverted and output to the pin nStrobe.

(8) Parallel Port Data FIFO (cFifo) (Secondary Base+0h, Mode 010)

Bytes written or DMA transferred from the Host to this FIFO are sent by a hardware handshake to the peripheral according to the standard parallel port protocol. This operation is only defined for the forward direction.

(9) ECP Data FIFO (ecpDFifo) (Secondary Base+0h, Mode 011)

When the direction bit dcr(5) is 0, bytes written or DMA transferred from the Host to this FIFO are sent by a hardware handshaking to the peripheral according to the ECP parallel port protocol. When the dcr(5) is 1, data bytes from the peripheral to this FIFO are read in an automatic hardware handshaking. The Host can acquire these bytes by performing READ operations or DMA transfers from this FIFO.

(10) Test FIFO mode (tFifo) (Secondary Base+0h, Mode 100)

The Host may operate READ/WRITE or DMA transfers to this FIFO in any direction. Data in this FIFO will be displayed on the PD bus without using hardware protocol handshaking. The tFifo will not accept new data after it is full. Performing a READ from an empty tFifo causes the last data byte to return.

(11) Configuration Register A (cnfgA) (Secondary Base+0h, Mode 111)

This read-only register indicates to the system that interrupts are ISA-Pulses. This is an 8-bit implementation by returning a 10h.

(12) Configuration Register B (cnfgB) (Secondary Base+1h, Mode 111)

This register is read-only.

cnfgB(7): Logic zero READ indicates that the chip does not support hardware RLE compression.

cnfgB(6): Returns the value on the ISA IRQ line to warn possible conflicts.

cnfgB(5)~cnfgB(3) : A value 000 READ indicates that the interrupt must be selected with jumpers.

cnfgB(2)~cnfgB(0) : A value 000 READ indicates that the DMA channel is a jumpered 8-bit DMA.

(13) Extended Control Register (ECR) (Secondary Base+2h, Mode All)
Table 7-38. Extended Control Register (ECR) Mode and Description

| ECR | Mode and Description |
|----------|--|
| 000 | Standard Parallel Port Mode. The FIFO is reset and the direction bit dcr(5) is always 0 (forward direction) in this mode. |
| 001 | PS/2 Parallel Port Mode. It is similar to the SPP mode, except that the dcr(5) is READ/WRITE. When dcr(5) is 1, the PD bus is tristate. Reading the data port returns the value on the PD bus instead of the value of the data register. |
| 010 | Parallel Port Data FIFO Mode. This mode is similar to the 000 mode, except that the Host writes or DMA transfers the data bytes to the FIFO. The FIFO data is then automatically sent to the peripheral using the standard parallel port protocol. This mode is only valid in the forward direction (dcr(5)=0) |
| 011 | ECP Parallel Port Mode. In the forward direction, bytes placed into the ecpDFifo and ecpAFifo are placed in a single FIFO and automatically sent to the peripheral under ECP protocol. In the reverse direction, bytes are sent to the ecpDFifo from ECP port. |
| 100, 101 | Reserved, not defined |
| 110 | Test mode. In this mode, the FIFO may be read from or written to, but it cannot be sent to peripheral. |
| 111 | Configuration mode. In this mode, the cnfgA and cnfgB registers are accessible at 0x400 and 0x401. |

www.DataSheet4U.com

ECP function control register.

ecr(7)~ecr(5): These bits are used for
READ/WRITE and Mode selection.

ecr(4): nErrIntrEn, READ/WRITE, Valid in
ECP(011) Mode

- 1: Disables the interrupt generated on the asserting edge of the nFault input.
- 0: Enables the interrupt pulse on the asserting edge of the nFault. An interrupt pulse will be generated if nFault is asserted, or if this bit is written from one to zero in the low level nFault.

ecr(3): dmaEn, READ/WRITE

- 1: Enables DMA. DMA starts when serviceIntr (ecr(2)) is 0.
- 0: Disables DMA unconditionally.

ecr(2): serviceIntr, READ/WRITE

- 1: Disables DMA and all service interrupts
- 0: Enables the service interrupts. This bit will be set to 1 by hardware when one of the three service interrupts has occurred. Writing one to this bit will not generate an interrupt.

Case 1: dmaEn=1

During DMA, this bit is set to one (1) (a service interrupt generated) when terminal count is reached.

Case 2: dmaEn=0, dcr(5)=0

This bit is set to 1 (a service interrupt generated) whenever there is writeIntrThreshold or more space-free bytes in the FIFO.

Case 3: dmaEn=0, dcr(5)=1

This bit is set to 1 (a service interrupt generated) whenever there is READIntrThreshold or more valid bytes to be read from the FIFO.

ecr(1): full, read-only

- 1: The FIFO is full and cannot accept another byte.

0: The FIFO has at least one free data byte space.

ecr(0): empty, read only

- 1: The FIFO is empty.
- 0: The FIFO contains at least one data byte.

(14) Mode Switching Operation

In programmed I/O control (mode 000 or 001), P1284 negotiation and all other tasks happening before data is transferred, and are controlled by software. Setting mode to 011 or 010 will cause the hardware to perform an automatic control-line handshaking and transferring information between FIFO and the ECP port.

From mode 000 or 001, any other mode may be immediately switched to or from the other mode. To change direction, the mode must first be set to 001.

In extended forward mode, FIFO must be cleared and all signals deasserted before returning to mode 000 or 001. In ECP reverse mode, all data must be read from the FIFO before returning to mode 000 or 001. Unneeded data is usually accumulated during ECP reverse handshaking, as when mode is changed during a data transfer. If the above condition is satisfied, nAutoFd will be deasserted regardless of the transfer state. To avoid bugs during handshaking signals, these guidelines must be followed.

(15) Software Operation (ECP)

Before ECP operation can begin, it is first necessary for the Host to switch the mode to 000 to negotiate with the parallel port. Host determines whether peripheral supports ECP protocol during the process.

After the negotiation is completed, the mode is set to 011 (ECP). To enable the drivers, direction must be set to 0. Both strobe and autoFd are set to 0, causing the nStrobe and nAutoFd signals to be deasserted.

All FIFO data transfers are PWord wide and PWord aligned. Permitted only in the forward direction, address/RLE transfers are byte-

www.DataSheet4U.com

wide. ECP address/RLE bytes may be sent automatically by writing the `ecpAFifo`. Similarly, data PWords may be sent automatically via `ecpDFifo`.

To change directions, the Host switches mode to 001. It then negotiates either the forward or reverse channel, sets direction to one or zero, and finally switches mode to 001. If the direction is set to 1, the hardware performs a handshaking for each ECP data byte READ, and tries to fill the FIFO. At this time, PWords may be read from the `expDFifo` while it retains data. It is also possible for the hardware to perform ECP transfers by handshaking with individual bytes under program control in mode = 001, or 000, even though this is a comparatively time-consuming approach.

(16) Hardware Operation (DMA)

Standard PC DMA protocol is followed. As in the programmed I/O case, the software sets direction and state. Next, the desired count and memory address are programmed into DMA controller. The `dmaEn` is set to one, and the `serviceIntr` is set to zero. To complete the process, the DMA channel with the DMA controller is unmasked. The contents in the FIFO are emptied or filled by DMA using the right mode and direction.

DMA is always transferred to or from the FIFO located at 0 x 400. By generating an interrupt and asserting a `serviceIntr`, DMA is disabled when the DMA controller reaches the terminal count. By not asserting `dREQ` for more than 32 consecutive DMA cycles, blocking of refresh requests is eliminated.

When it is necessary to disable a DMA while this is performing a transfer, the host DMA controller is disabled `serviceIntr` is then set to one, and `dmaEn` is next set to 0. The DMA will start again whether or not the contents in FIFO are empty or full. This is done first by enabling the host DMA controller, then setting `dmaEn` to one. The procedure is completed with `serviceIntr` set to 0. Upon completion of a DMA transfer in the forward direction, the software program must wait until the contents in FIFO are empty and the busy line is low to ensure

that all data successfully reaches the peripheral device.

(17) Interrupts

When any of the following states are reached, it is necessary to generate an interrupt.

1. `serviceIntr` = 0, `dmaEn` = 0, `direction` = 0, and the number of PWords in FIFO is greater than or equal to `writeIntrThreshold`.
2. `serviceIntr` = 0, `dmaEn` = 0, `direction` = 1, and the number of full PWords in the FIFO is greater than or equal to `READIntrThreshold`.
3. `serviceIntr` = 0, `dmaEn` = 1, and DMA reaches the terminal count.
4. `nErrIntrEn` = 0 and `nFault` goes from high to low or when `nErrIntrEn` is set from one to zero and `nFault` is asserted.
5. `ackIntEn` = 1. In current implementations using existing parallel ports, the generated interrupt may be either edge or level type, making it "ISA-friendly".

(18) Interrupt Driven Programmed I/O

It is also possible to use an interrupt-driven programmed I/O to execute either ECP or parallel port FIFOs. An interrupt will occur in the forward direction when `serviceIntr` is 0 and the number of free PWords in the FIFO is equal to or greater than `writeIntrThreshold`. If either of these conditions is not met, it may be filled with `writeIntrThreshold` PWords. An interrupt will occur in the reverse direction when `serviceIntr` is 0 and the number of available PWords in the FIFO is equal to `READIntrThreshold`. If it is full, the FIFO can be emptied completely in a single burst. If it is not full, only a number of PWords equal to `READIntrThreshold` may be read from the FIFO in a single burst. In the test mode, software can determine the values of `writeIntrThreshold`, `READIntrThreshold`, and FIFO depth while accessing the FIFO.

www.DataSheet4U.com

Any PC ISA implementation that is adjusted to expedite DMA or I/O transfer must ensure that the bandwidth on the ISA is maintained in the interface. Although the PC ISA bus cannot be directly controlled, the interface bandwidth of the ECP port can be constrained to perform at the optimum speed.

(19) Standard Parallel Port

In the forward direction with DMA, the standard parallel port is run at or near the permitted peak bandwidth of 500Kbytes/sec. The state machine does not examine nAck, but just begins the next DMA based on the Busy signal.

7.6 Keyboard Controller (KBC)

The keyboard controller is implemented using an 8-bit microcontroller that is capable of executing the 8042 instruction set. In addition, the microcontroller can enter power-down mode by executing two kinds of power-down instructions. The 8-bit microcontroller has 256 bytes of RAM for data memory and 2 Kbytes of ROM for program storage.

The ROM codes may come from various vendors (or users), and are programmed during the manufacturing process. To assist in developing ROM codes, the keyboard controller has an external access mode. In the external access mode, the internal ROM is disabled and the instructions executed by the microcontroller come from an externally connected ROM.

7.6.1 System Interface

Refer to Figure 7-2. The keyboard controller interfaces with the system through the pins shown in the figure. IOR* is the system READ. IOW* is the system WRITE. SA0-11 are the address pins. SD0-7 are the data bus pins. The keyboard controller decodes from system addresses 60h or 64h as its chip select signal. KRST* is pin P20 of the microcontroller. GATEA20 is pin P21 of the microcontroller. KCLK is the keyboard clock pin; its output is the inversion of pin P26 of the microcontroller, and the input of KCLK is connected to the T0 pin of the microcontroller. KDAT is the keyboard data pin; its output is the inversion of pin P26 of the microcontroller, and the input of KDAT is connected to the P10 of the microcontroller. MCLK is the mouse clock pin; its output is the inversion of pin P23 of the microcontroller, and the input of MCLK is connected to the T1 pin of the microcontroller. MDAT is the keyboard data pin; its output is the inversion of pin P22 of the microcontroller, and the input of KDAT is connected to the P11 of the microcontroller.

Note that the inputs of KCLK and MCLK respectively are connected to the T0 pin and T1 pin of the microcontroller. This means that the inputs to the KCLK and MCLK are tested while the microcontroller is executing conditional jump instructions. Also, the MCLK drives the internal event counter.

7.6.2 Data Registers and Status Register

The keyboard provides two data registers, one is DBIN for data input, the other is DBOU for data output. The data registers are both 8-bit wide. The status register holds information concerning the status of the data registers, the internal flags, and some user-defined status bits. Please refer to Figure 7-3. OBF is set to 1 when the microcontroller write a data into DBOU, and is cleared when the system initiates a DATA READ operation. IBF is set to one when the system initiates a WRITE operation, and is cleared when the microcontroller executes an "IN A, DBB" instruction. The F0 and F1 flags can be set or reset when the microcontroller executes clear and complement flag instructions. F1 also holds system WRITE information when the system performs WRITE operations.

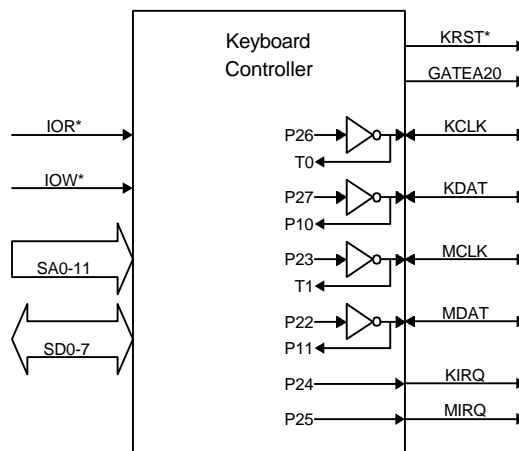

Figure 7-2. Keyboard Controller System Interface

Figure 7-3. Status Register

Table 7-39. Data Register READ/WRITE Controls

| Chip Select | A0 | IOR* | IOW* | Condition |
|-------------|----|------|------|----------------------|
| 0 | 0 | 0 | 1 | READ DBOUT |
| 0 | 1 | 0 | 1 | READ Status |
| 0 | 0 | 1 | 0 | WRITE DBIN, clear F1 |
| 0 | 1 | 1 | 0 | WRITE DBIN, set F1 |
| 1 | x | x | x | Disable |

7.6.3 Program Memory

The keyboard controller provides a 2-Kbyte ROM as program storage, with an 11-bit program counter to address the program memory. In the 2-Kbyte address space, three addresses are reserved for interrupt vectors.

Address 0 is reserved for system reset. The microcontroller starts executing the ROM code from address 0 following a system reset.

Address 3 is reserved for the IBF interrupt. An IBF interrupt occurs when the system writes data or a command into the DBIN register and the interrupt is enabled.

Address 7 is reserved for the timer overflow interrupts. The timer/counter of the keyboard controller is 8-bits wide, and can count up to 255 (FFh). After 255, the counter starts counting from 0 and sets the timer overflow interrupt.

7.6.4 Program Status Word

There is a program status word that stores various microcontroller status. Please refer to Figure 7-4. S2 through S0 is the stack pointer pointing into the stack in the data memory. The stack is 8-levels deep.

BS is the working bank selector which selects either bank 0 or bank 1 of the data memory.

F0 is a general purpose flag that can be cleared, complemented, and tested by conditional jump instructions.

AC is the auxiliary carry flag that is affected when the microcontroller performs an ADD instruction, and is tested by the decimal adjustment instructions.

CY is the carry flag indicating the overflow condition results from an add operation in the accumulator of the microcontroller.

Figure 7-4. Program Status Word

7.6.5 Data Memory

There are 256 bytes in the data memory. The data memory is configured as two register banks, an 8-level stack, and user RAM spaces. Each register bank has eight registers. All memory spaces can be indirectly addressed by the microcontroller through R0 and R1 of the two register banks. Only the registers in the two register banks can be directly addressed by the microcontroller. Each level of the 8-level stack occupies 2 bytes of memory, thus the stack takes 16 bytes. The memory spaces from 032 to 255 are reserved for users. Please refer to Figure 7-5.

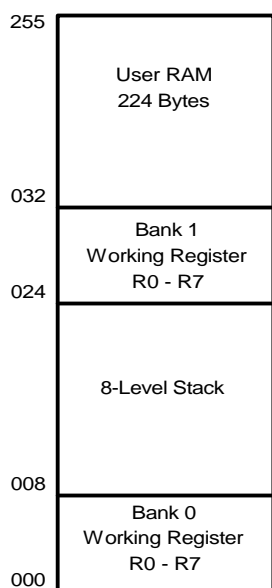

Figure 7-5. Data Memory Configuration

The stack contains information needed in programming the control transfers. Program control transfer occurs when the microcontroller executes CALL, RET or RETR instructions, or an interrupt forces control transfer to its service routine. In case of a CALL instruction or an interrupt, the contents of the program counter and bit 4 through bit 7 of the program status word are pushed onto the stack. In case of a RET or RETR instruction, the stack is popped, and the content of the program counter is restored.

7.6.6 Instruction Timing

Please refer to Figure 7-6. The internal system clock is divided by 3 to generate the state clock. The state clock is then again divided by 5 to generate the cycle clock. Consequently, an instruction cycle takes fifteen system clock cycles to complete. The cycle clock is again divided by 32 to further generate the timer clock.

7.6.7 Timer/Counter Operation

The 8-bit timer/counter is configured by software in the ROM. Please refer to Figure 7-6. To enter the timer mode, the microcontroller executes the STRT T instruction. In the timer mode, the input of the 8-bit counter is derived from the system clock divided by 480 (the timer clock).

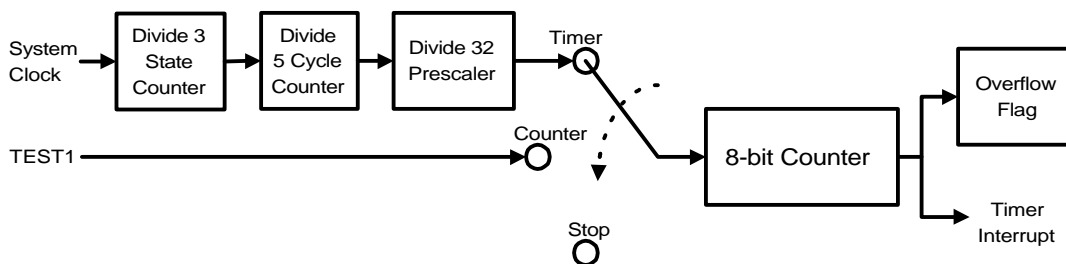

Figure 7-6. Instruction Timing and Timer/Counter Operation

www.DataSheet4U.com

The counter mode is selected by executing the instruction `STRT CNT`. In the counter mode, pin `TEST1` is sampled every instruction cycle to check for a high level. If a high level is detected, then the 8-bit counter increments by one. The instruction `STOP TCNT` stops both the timer and the counter. In case the 8-bit counter overflows (from `FF` to `00`) the overflow flag is set. The instruction `EN TCNTI` enables the timer interrupt; thus when an overflow occurs, the 8-bit counter generates an timer interrupt. A system-reset resets both the overflow flag and the 8-bit counter, and stops either the timer or the counter. The 8-bit counter can be loaded or read by the `MOV` instruction.

7.6.8 KIRQ and MIRQ

KIRQ is the interrupt request for keyboard (Default `IRQ1`), and MIRQ is the interrupt request for mouse (Default `IRQ12`). KIRQ is internally connected to `P24` pin of the microcontroller, and MIRQ is internally connected to pin `P25` of the microcontroller.

8. DC Electrical Characteristics

Absolute Maximum Ratings*

Applied Voltage -0.5V to 7.0V
 Input Voltage (Vi) -0.5V to VCC+0.5V
 Output Voltage (Vo) -0.5V to VCC + 0.3V
 Operation Temperature (Topt) . 0°C to +70°C
 Storage Temperature -55°C to +125°C
 Power Dissipation 300mW

*Comments

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

DC Electrical Characteristics (VCC = 5V ± 5%, Ta = 0°C to + 70°C)

| Symbol | Parameter | Min. | Typ. | Max. | Unit | Conditions |
|--------------------------|---------------------|------|------|------|------|--------------------------|
| I/O24 Type Buffer | | | | | | |

9.4.3 Receiver

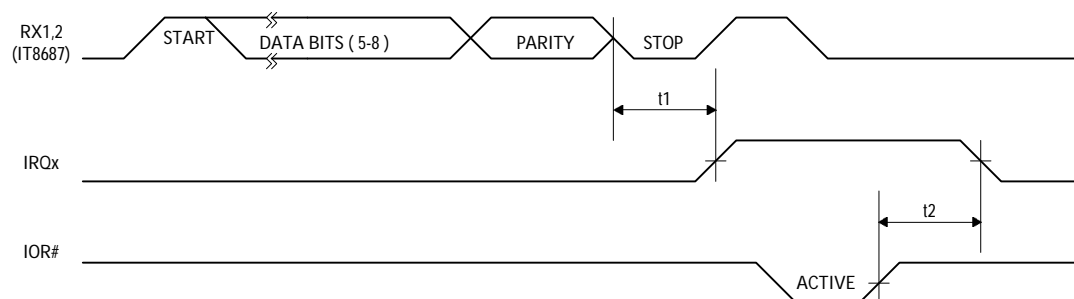

Table 9-9. Receiver of Serial Port Timing

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------|---|------|------|------|--------------------|
| t1 | Delay from stop (RX, IT8687) to set IRQx | | 8 | | clk _{ACE} |
| t2 | Delay from IOR# ↑ (RD RBR/RD LSR) to reset interrupt IRQx | | 55 | | ns |

Note: clk_{ACE} stands for ACE actual input clock, i.e. 24/13=1.846 MHz internal clock.

9.4.4 IrDA Receive Timing

PULSE WIDTH t1 = 3/16 OF BIT TIME t2

Table 9-10. IrDA Receive Timing of Serial Port Timing

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------|---------------------------|------|------|-------|------|
| t1 | Pulse Width at 115 kbaud | 1.41 | 1.6 | 2.71 | us |
| t1 | Pulse Width at 57.6 kbaud | 2.82 | 3.22 | 3.69 | us |
| t1 | Pulse Width at 38.4 kbaud | 4.23 | 4.8 | 5.53 | us |
| t1 | Pulse Width at 19.2 kbaud | 7.05 | 9.7 | 11.07 | us |
| t1 | Pulse Width at 9.6 kbaud | 14.1 | 19.5 | 22.13 | us |
| t1 | Pulse Width at 4.8 kbaud | 28.2 | 39 | 44.27 | us |
| t1 | Pulse Width at 2.4 kbaud | 56.4 | 78 | 88.5 | us |
| t2 | Bit Time at 115 kbaud | | 8.68 | | us |
| t2 | Bit Time at 57.6 kbaud | | 17.4 | | us |
| t2 | Bit Time at 38.4 kbaud | | 26 | | us |
| t2 | Bit Time at 19.2 kbaud | | 52 | | ms |
| t2 | Bit Time at 9.6 kbaud | | 104 | | ms |
| t2 | Bit Time at 4.8 kbaud | | 208 | | ms |
| t2 | Bit Time at 2.4 kbaud | | 416 | | ms |

Note: IrDA @ 115k is HPSIR compatible. IrDA @ 2400 will allow compatibility with HP95LX and 48SX.

9.4.5 IrDA Transmit Timing

PULSE WIDTH $t_1 = 3/16$ OF BIT TIME t_2

Table 9-11. IrDA Transmit Timing of Serial Port Timing

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------|---------------------------|------|------|-------|------|
| t1 | Pulse Width at 115 kbaud | 1.41 | 1.6 | 2.71 | ms |
| t1 | Pulse Width at 57.6 kbaud | 2.82 | 3.22 | 3.69 | ms |
| t1 | Pulse Width at 38.4 kbaud | 4.23 | 4.8 | 5.53 | ms |
| t1 | Pulse Width at 19.2 kbaud | 7.05 | 9.7 | 11.07 | ms |
| t1 | Pulse Width at 9.6 kbaud | 14.1 | 19.5 | 22.13 | ms |
| t1 | Pulse Width at 4.8 kbaud | 28.2 | 39 | 44.27 | ms |
| t1 | Pulse Width at 2.4 kbaud | 56.4 | 78 | 88.5 | ms |
| t2 | Bit Time at 115 kbaud | | 8.68 | | ms |
| t2 | Bit Time at 57.6 kbaud | | 17.4 | | ms |
| t2 | Bit Time at 38.4 kbaud | | 26 | | ms |
| t2 | Bit Time at 19.2 kbaud | | 52 | | ms |
| t2 | Bit Time at 9.6 kbaud | | 104 | | ms |
| t2 | Bit Time at 4.8 kbaud | | 208 | | ms |
| t2 | Bit Time at 2.4 kbaud | | 416 | | ms |

Note: Criteria for Receive Pulse Detection - A received pulse is considered detected if the pulse width is 1.4 ms minimum.

9.4.6 ASKIR Receive Timing

Table 9-12. ASKIR Receive Timing of Serial Port Timing

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------|--------------------------|------|------|------|------|
| t1 | Modulated Input Bit Time | | | | us |
| t2 | Off Bit Time | | | | us |
| t3 | Modulated Input "high" | 0.8 | 1 | 1.2 | us |
| t4 | Modulated Input "low" | 0.8 | 1 | 1.2 | us |

Note: MIRSIN is the modulated input.

9.4.7 ASKIR Transmit Timing

Table 9-13. ASKIR Transmit Timing of Serial Port Timing

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------|---------------------------|------|------|------|------|
| t1 | Modulated Output Bit Time | | | | ms |
| t2 | Off Bit Time | | | | ms |
| t3 | Modulated Output "high" | 0.8 | 1 | 1.2 | ms |
| t4 | Modulated Output "low" | 0.8 | 1 | 1.2 | ms |

Note: MIRSOUT is the modulated output.

9.5 Parallel Port Timing

9.5.1 Control Signal Delay Time

Table 9-14. Control Signal Delay Time of Parallel Port Timing

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------|---|------|------|------|------|
| t1 | Delay from IOW# ↑ (WR CTRL PORT) to STB# valid | | 60 | | ns |
| t2 | Delay from IOW# ↑ (WR CTRL PORT) to AFD# valid | | 60 | | ns |
| t3 | Delay from IOW# ↑ (WR CTRL PORT) to INIT# valid | | 60 | | ns |
| t4 | Delay from IOW# ↑ (WR CTRL PORT) to SLIN# valid | | 60 | | ns |

9.5.2 Interrupt Request Timing

Table 9-15. Interrupt Request Timing of Parallel Port Timing

| Symbol | Parameter | Min. | Typ. | Max. | Unit |
|--------|-----------------------------|------|------|------|------|
| t1 | Delay from ACK# ↓ to IRQx ↓ | | 30 | | ns |
| t2 | Delay from ACK# ↑ to IRQx ↑ | | 30 | | ns |

| 7-1. AC Characteristics | 6 |

1. Features

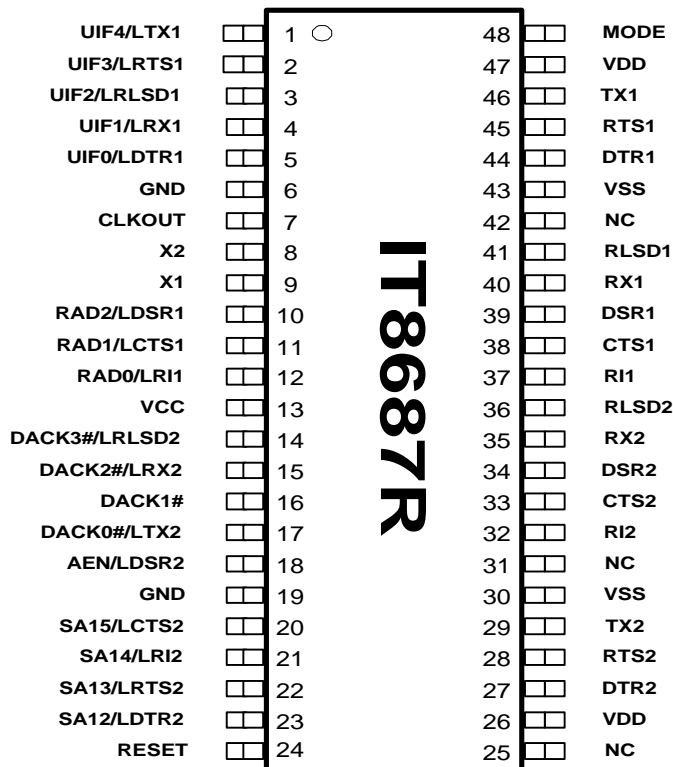

- Contains 6 line drivers (1488) and 10 line receivers(1489)
- Supports 2 RS-232 serial ports
- Very low power consumption (150mW)
- Supports 1 crystal oscillator clock generator
- Four power supply inputs:0V, 5V, -12V, +12V
- High voltage CMOS process
- 48-pin SSOP package

2. General Description

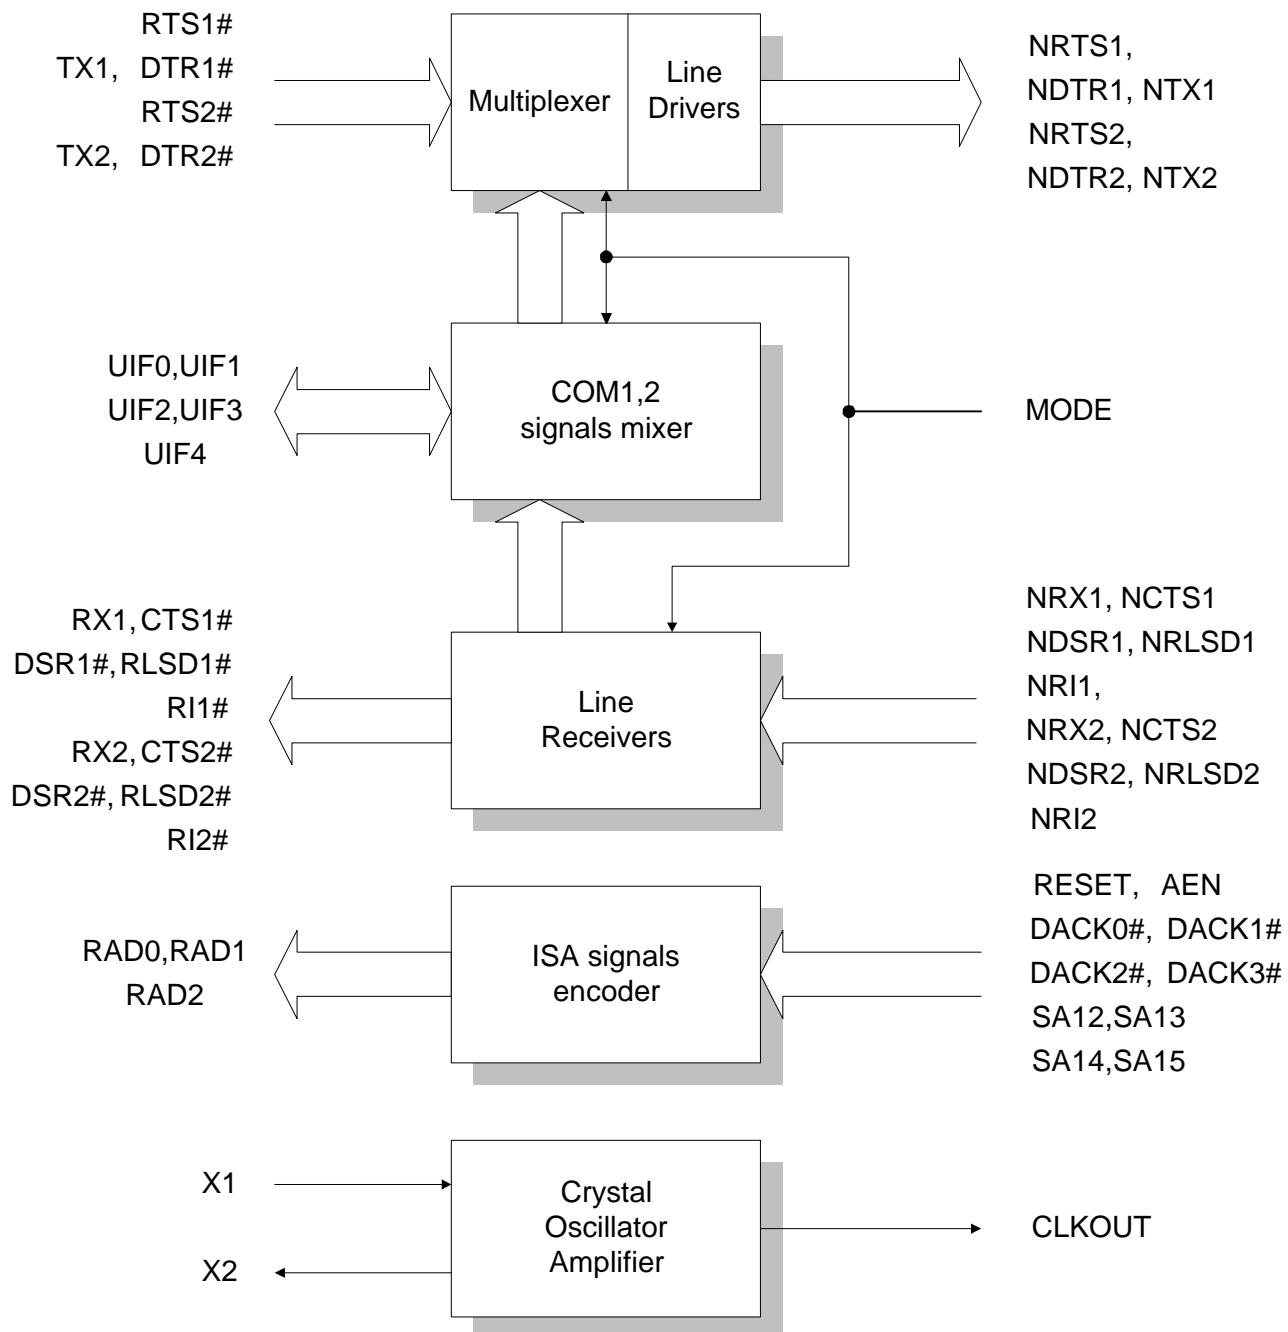

IT8687R integrates 6 line drivers, 10 line receivers, 1 ISA signal encoder, 1 UART signal-mixing control logic, and 1 24/48 MHz clock generator. The ISA signals; (1) SA12, SA13, SA14, SA15, DACK0#, DACK1#, DACK2#, DACK3#, AEN, RESET are encoded into three signals -- RAD0, RAD1, RAD2. 16 UART interface signals are encoded into UIF0,

UIF1, UIF2, UIF3, UIF4 to minimize the pin count and the package cost. This low power consumption chip is designed to serve as an interface between data terminal equipment and data communication equipment in conformance with the EIA standard RS-232 specifications.

3. Pin Configuration

4. Block Diagram

5. IT8687R Pin Description

Table 5-1. Signal Names (by pin numbers in alphabetical order)

| Pin No. | Symbol | I/O | Description |
|---------|----------------|-------|--|
| 1 | UIF4/LTX1 | IS | Serial ports 1,2 signals sample clock input. The second function is Serial Port 1 TX line driver input. |
| 2 | UIF3/LRTS1 | IS | Serial ports 1,2 transfer cycle indicator. The second function is Serial Port 1 RTS line driver input. |
| 3 | UIF2/LRLSD1 | O18 | Serial port 2 signals RLSD2, RX2, DSR2, CTS2, RI2 mixing-signal output pin. The second function is Serial Port 1 RLSD line receiver output. |
| 4 | UIF1/LRX1 | O18 | Serial port 1 signals RLSD1, RX1, DSR1, CTS1, RI1 mixing-signal output pin. The second function is Serial Port 1 RX line receiver output. |
| 5 | UIF0/LDTR1 | IS | Serial ports 1,2 signals TX1, TX2, RTS1, RTS2, DTR1, DTR2 mixing-signal input pin. The second function is Serial Port 1 DTR line driver input. |
| 7 | CLKOUT | O8 | Output clock generated by the crystal oscillator |
| 8 | X2 | O | Crystal oscillator output |
| 9 | X1 | I | Crystal oscillator input |
| 10 | RAD2/LDSR1 | O18 | ISA signal encoding output pin 2. The second function is Serial Port 1 DSR line receiver output. |
| 11 | RAD1/LCTS1 | O18 | ISA signal encoding output pin 1. The second function is Serial Port 1 CTS line receiver output. |
| 12 | RAD0/LRI1 | O18 | ISA signal encoding output pin 0. The second function is Serial Port 1 RI line receiver output. |
| 14 | DACK3#/ LRLSD2 | I/O18 | ISA DMA Acknowledge 3, active low. The second function is Serial Port 2 RLSD line receiver output. |
| 15 | DACK2#/ LRX2 | I/O18 | ISA DMA Acknowledge 2, active low. The second function is Serial Port 2 RX line receiver output. |
| 16 | DACK1# | IS | ISA DMA Acknowledge 1, active low |
| 17 | DACK0#/ LTX2 | IS | ISA DMA Acknowledge 0, active low. The second function is Serial Port 2 TX line driver input. |
| 18 | AEN/LDSR2 | I/O18 | Address Enable, active high indicates system is in DMA transfer mode. The second function is Serial Port 2 DSR line receiver output. |
| 20 | SA15/LCTS2 | I/O18 | ISA I/O Address 15. The second function is Serial Port 2 CTS line receiver output. |
| 21 | SA14/LRI2 | I/O18 | ISA I/O Address 14. The second function is Serial Port 2 RI line receiver output. |

Table 5-1. Signal Names (by pin numbers in alphabetical order) [cont' d]

| Pin No. | Symbol | I/O | Description |
|-------------|------------|------|--|
| 22 | SA13/LRTS2 | IS | ISA I/O Address 13. The second function is Serial Port 2 RTS line driver input. |
| 23 | SA12/LDTR2 | IS | ISA I/O Address 12. The second function is Serial Port 2 DTR line driver input. |
| 24 | RESET | IS | System reset, active high |
| 27 | DTR2 | O16H | Serial port 2 DTR line driver output |
| 28 | RTS2 | O16H | Serial port 2 RTS line driver output |
| 29 | TX2 | O16H | Serial port 2 TX line driver output |
| 32 | RI2 | ISH | Serial port 2 RI line receiver input |
| 33 | CTS2 | ISH | Serial port 2 CTS line receiver input |
| 34 | DSR2 | ISH | Serial port 2 DSR line receiver input |
| 35 | RX2 | ISH | Serial port 2 RX line receiver input |
| 36 | RLSD2 | ISH | Serial port 2 RLSD line receiver input |
| 37 | RI1 | ISH | Serial port 1 RI line receiver input |
| 38 | CTS1 | ISH | Serial port 1 CTS line receiver input |
| 39 | DSR1 | ISH | Serial port 1 DSR line receiver input |
| 40 | RX1 | ISH | Serial port 1 RX line receiver input |
| 41 | RLSD1 | ISH | Serial port 1 RLSD line receiver input |
| 44 | DTR1 | O16H | Serial port 1 DTR line driver output |
| 45 | RTS1 | O16H | Serial port 1 RTS line driver output |
| 46 | TX1 | O16H | Serial port 1 TX line driver output |
| 48 | MODE | IS | Primary function is selected when this pin is low; secondary function is selected when it is high. |

| 6,19 | GND | | Ground |
| 13 | VCC | | +5V power |
| 30,43 | VSS | | -12V power |
| 26,47 | VDD | | +12V power |

6. DC Electrical Characteristics

Absolute Maximum Ratings

Ambient Operating Temperature 0°C to +70°C
 Storage Temperature -55°C to +150°C
 Supply Voltage to Ground Potential..... -0.5V to VCC+0.3V
 Supply Hi-Voltage to Ground Potential ±0.5V to ±12V
 Applied Normal Output Voltage 0.5V to VCC+0.3V
 Applied Normal Input Voltage -0.5V to 7V
 Applied I/O High Voltage -0.5V to +15V
 Power Dissipation 300mW

*Comments

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to this device. These are stress ratings only. Functional operation of this device at these or any other conditions above those indicated in the operational sections of this specification is not implied or intended. Exposure to the absolute maximum rating conditions for extended periods may affect device reliability.

Table 6-1. DC Electrical Characteristics

| Symbol | Parameter | Min. | Typ. | Max. | Unit | Conditions |
|--|---------------------|------|------|------|------|-------------------------|
| IS Type Buffer (VCC=5V) | | | | | | |
| I _{IL} | Input Low Leakage | | | 10 | μA | V _{IN} = 0 |
| I _{IH} | Input High Leakage | | | -10 | μA | V _{IN} = VCC |
| V _{IL} | Input Low Voltage | | | 0.7 | V | |
| V _{IH} | Input High Voltage | 3.0 | | | V | |
| I Type Buffer (VCC=5V) | | | | | | |
